Office of the Sany. Commr. for Bengal,
The 24th April 1885.

R. LIDDERDALE, M.D.
Deputy Surgeon-General,
Sanitary Commissioner for Bengal.

APPENDIX No. III.

SUMMARY OF SANITARY WORKS, IMPROVEMENTS, &c., CARRIED OUT IN TOWNS AND DISTRICTS

DURING THE YEAR 1884.

Summary of Sanitary Works, Improvements, &c., which were carried out in Towns and Districts during the year 1884.

CONSERVANCY

In Towns.

Latrines and Urinals.

Public Latrines and Urinals were constructed in the following Municipalities—

TOWNS.	DISTRICTS.	NUMBER WITH REMARKS.
Ghattal ...	... Midnapore ...	4 pucca latrines (1 in progress).
Serampore ...	... Serampore ...	7 urinals in different places and 1 latrine in Rishra
Bansberia ...	... Hughli ...	1 latrine in progress.
Bhudressur ...	... Ditto ...	1 latrine.
Bali ...	.. Howrah ...	1 ditto.
Howrah ..	... Ditto	2 urinals, 1 at Chandmari road and 1 at the Kutchery.
Suburbs of Calcutta	... 24-Pergunnahs ...	Chambered urinals in Magistrate's office compound (number not stated).
City Murshidabad	... Murshidabad ...	3 latrines (1 in progress).
Dinajpur ...	... Dinajpur ...	5. Two latrines at Borobunder, 1 at Ramnagar and 2 at Patrarpur.
Rungpore ...	... Rungpore ..	1 latrine with sweeper's house.
Sherpur ...	... Bogra ..	10. Seven latrines and three urinals.
Serajgunge ...	... Pubna ...	1 Latrine.
Darjiling ...	... Darjiling ...	4. Two latrines and 2 urinals.
Kurseong ...	... Ditto ...	4. Three latrines and 1 urinal.
Naraingunge ...	... Dacca ...	1 latrine near Gopinathjee's Akra
Barisal ...	... Backergunge ...	2 latrines, one at Hatkhola and 1 at Kotwalli.
Chittagong ...	... Chittagong ...	1 latrine at Underkilla with iron posts and corrugated roofs.
Brahmanberia ...	... Tipperah ...	Number not mentioned.
Behar ...	... Patna ...	1 latrine
Dinapore ...	... Do. ...	5 portable latrines.
Khagowl ...	... Do. ...	5 ditto
Jehanabad ...	... Gya .	Number not stated.
Mozufferpore ..	.. Mozufferpore .	1 latrine for females at Goadree bazar.
Durbhanga ...	... Durbhanga ...	2 tattie latrines
Madhubani ...	... Ditto ...	4 latrines.
Roserah ...	... Ditto ...	4 ditto.
Chupra ..	... Sarun ...	1 iron urinal.
Monghyr ...	... Monghyr ...	2 latrines.
Jamalpore ...	... Ditto ...	1 pucca latrine.
Bhagulpore ...	... Bhagulpore ...	12 pucca latrines.
Sahebgunge ...	... Sonthal Pergunnahs	3 tattie latrines.
Cuttack ...	... Cuttack ...	2 latrines, one for males and 1 for females at Gossain-bagicha.
Puri ...	... Puri ...	2. One pucca latrine near the kutchery, and one Ramsay's portable latrine.
Hazaribagh ...	... Hazaribagh ...	1 latrine near market.
Ranchi ...	... Lohardugga ...	1 latrine.
Daltongunge ...	... Ditto ..	1 ditto.

Carts, Bullocks, &c.

Conservancy and night-soil carts, with bullocks, &c., for the more efficient carrying out of conservancy arrangements, were provided in the under-mentioned Municipalities—

TOWNS.	DISTRICTS.	NATURE OF WORK.
Santipore ...	... Nuddea ...	3 scavenging carts with bullocks.
Julpaiguri ...	... Julpaiguri ...	1 Cantwell's patent night-soil cart.
Faridpore ...	... Faridpore ...	1 conservancy cart.
Dinapore ...	... Patna ...	Number not stated.
Behar ...	... Do. ...	5 conservancy carts.
Nobinuggur ...	... Gya ...	1 conservancy cart.
Obra ...	... Do. ...	1 Ditto.
Durbhanga ...	... Durbhanga ...	2 night-soil carts.
Chupra ...	... Sarun ...	8 conservancy and night-soil carts.
Ditto ...	... Do. ...	8 conservancy hand carts.
Sahebgunge ...	... Sonthal Pergunnahs	1 watering cart.
Puri ...	... Puri ...	6 metallic night-soil carts.

Conservancy Establishment.

In the following Municipalities the Conservancy establishments were strengthened—

TOWNS.	DISTRICTS.	NUMBER WITH REMARKS.
Midnapore ...	... Midnapore	... 1 Sanitary Inspector appointed.
Sherpur ...	... Bogra	... 5 additional mehters.

Buildings constructed for Conservancy purposes.

Under this head the following were undertaken: a pucca shed for the conservancy cattle at Bullubpore in Serampore and some shed at Baidabatti, both in the Hughli district; a shed for mehters at Patrarpur in Dinajpur; one house for sweepers at Rungpore; four sheds, two for bullocks, and two for mehters near trenching ground in Dacca; sheds for domes near the Murli hill and Bisar tank in Gya; a shed for conservancy bullocks; compound wall for the conservancy station at Jolhasahi; wooden railing near eastern conservancy station; and sheds for the conservancy carts at Monglabag in Cuttack.

General Conservancy Improvements.

Of the important general conservancy improvements which were effected during the year, the following deserve mention:—In the *Dacca* Municipality three of the abominable "gors" were filled up. In the *Patna* Municipality, after much opposition and controversy, the house scavenging scheme has been established in the City Proper which is most thickly populated. Five thousand, or half the number of private privies, are being cleaned, and the night-soil from them is trenched in grounds especially rented for the purpose. In the *Suburbs of Calcutta* the improvement of Woolfut-bagan bustee was taken in hand; the Motijheel and Katal-bagan bustees were inspected preliminary to sanitary improvements being carried out; and six other bustees, among which are the gowalla-bustees, regarding which it is proposed to establish public cow-sheds, were surveyed. Trees were planted on the roadsides and on the avenue road at Howrah; on the roads in the Serajgunge town in Pubna; on the roadsides in Gya (2,934) at a cost of Rs. 1,072-4; and on the sides of the station road and on the market compound in Purulia in Manbhum. The sanitary condition of the Seebpore and Banstolla foreshore and Howrah and Jugut Banerjee's Ghat in Howrah town was improved generally with regard to cleanliness, &c., at a cost of Rs. 904-3-6. A depôt near Hadis' house in the Mozufferpore town was constructed at a cost of Rs. 115-10-5. The ditch near the dispensary in the Sasseram town in Shahabad, and a large pit at Roserah in Durbhanga were filled up, the former at a cost of Rs. 99-11 and the latter at Rs. 311-9.

DRAINAGE

In Towns.

General Drainage Schemes carried out, or in hand.

The improvement of the drainage of the *Raniqunge* town in Burdwan is awaiting the report of the Engineer on the proposed scheme, the levels having been taken. At *Khulna*, formerly the head-quarters of the district, converted into a Municipality at the close of the year 1881, the drainage was diverted from its previous channels towards new channels at a cost of Rs. 16,997 to the Road Cess Department. The work has progressed to a good extent. In *Lalbagh* or *City Murshidabad* the drainage works at Azimgunge, commenced in 1883, have been completed, and the outlet, it is said, is now effective. Proposals referring to proper drainage schemes for *Jeagunge* and *Azimgunge*, and to the improvement of the present drainage system of the *Murshidabad* town proper, estimated to cost Rs. 30,000, are under consideration. Estimates and plans of the scheme for improving the drainage of the *Dinajpur* town, in connection with the general drainage project suggested by the Sanitary Commission of 1878, have been submitted to Government for sanction. The scheme for improving the drainage of the *Chittagong* town, referred to in the report for 1883, has not yet been taken up. The scheme for redigging the Chaktai nulla in the same town has also fallen out of sight. This, if carried out, would have immensely improved the drainage of a very large area of low-lying ground to the great advantage of the inhabitants therein. In fact, nothing can be done to drain this area till the Chaktai is redug. The question of radically improving the drainage of the *Patna* Municipality was under consideration during the year. The municipal Engineer was engaged throughout the rainy season investigating the matter, and has drawn up some excellent reports on a general drainage scheme. But it appears that it is beyond the means of the municipality to give effect to the undertaking, and that it would entail the raising of a large loan, take years to complete the work, and involve loss of money in surveys, &c. An alternative plan for providing the whole town with pucca spoon-shaped drains to carry off rain water only, is under consideration. The work of this year consisted of constructing surface drains in three of the mohullas, and completing (1) the largest pucca main drain, which conveys the drainage of an immense area under the railway line and then discharges it into low ground; and (2) the most important pucca sub-main drain, which conveys the drainage from the densely-populated parts near the chowk to the above-mentioned main drain. These works have, it is said, already proved of the greatest service. Their extension is necessary, but want of funds precludes this being done.

Other Drainage Measures.

New drains, with the necessary culverts, pipes, bridges, &c., were constructed, or alterations, &c., of existing drains calculated to improve drainage, such as providing culverts, pipes, sluices, protecting walls, &c., re-excavating, rectifying levels, removing of obstructions, carrying out extensions, &c., were effected in the following Municipalities—

TOWNS.	DISTRICTS.

In Districts.

Drainage Works carried out in the Districts.

Further improvements to the drainage of the fever-stricken district of *Nuddea* were effected, the work consisting of the construction of a good many arched culverts and wrought iron girder bridges on masonry abutments; of the completion of the works on the road from Chagda railway station to Bongong at a cost of Rs. 1,346; and of the construction of four arched culverts on the Chapra and Nishchindpur road at a cost of Rs. 1,967. These culverts span drainage channels. Many drainage schemes were prepared during the year, and some of them have been sanctioned, but none of them have yet been carried out for want of funds, and some elaborate schemes are under preparation. In the *Sonthal Pergunnahs* district the question of draining the stagnant marsh to the south of Rajmehal is still under consideration. Plans and estimates have been prepared, and enquiries are being instituted as to how far the proprietors of the land are prepared to contribute towards the project; but there are so many petty interests involved that it is doubted whether they will combine in carrying out the work. *Howrah.*—Drainage pipes were put up in different parts of the district at a cost of Rs. 700, and four bridges were constructed in the Uluberiah sub-division at a cost of Rs. 251. *24-Pergunnahs.*—A bridge was constructed over the Sursa khal in Diamond Harbour sub-division, the cost amounting to Rs. 2,019. *Rajshahye.*—Some drains were opened out at a cost of Rs. 180. *Pubna.*—A span of 5 running feet was made to bridge No. 1 on the Chatmohur road for the free drainage of the adjoining fields, and a bridge on the Saikol road in the Serajgunge sub-division was constructed. *Darjiling.*—Drainage works were undertaken at Silliguri and Matiagurah Hat at a cost of Rs. 555-10 and Rs. 1,963-7 respectively. *Backergunge.*—Ten khals were excavated in different parts of the district which cost Rs. 857. *Tipperah.*—Five khals were excavated in

villages at a cost Rs. 1,167-2-9. *Patna.*—One hundred and thirty-nine culverts were constructed, the cost being Rs. 23,184-9. *Gya.*—Surface drains were constructed in the Aurungabad sub-division. *Sarun.*—Bridges and culverts were constructed at a cost of Rs. 26,328. *Bhagulpore.*—Wooden bridges on roads Nos. 183 and 209 and two timber bridges on road No. 11 in Sudder sub-division were constructed *Maldah.*—Kutcha drains and tal-wood bridges were constructed at a cost of Rs. 4,000 and Rs. 1,917 respectively.

ROADS

In Towns.

New Roads.

New roads with the necessary appliances for securing drainage, waterway, &c., were constructed, or were in progress of construction, and existing roads were extended or widened in the undermentioned towns—

Ditto	2	Not stated.
Maldah	Not stated	1,150 0 0
Puri	Ditto	Not stated.
Manbhum	Ditto	Ditto.

WATER-SUPPLY

In Towns.

Hughli.—Mr. Finlay, the manager of the Wellington Jute Mills in the Serampore Municipality, had a large cistern constructed, capable of containing 73,000 gallons of water from the river of comparatively pure quality, for the benefit of the work people in the Mahesh and Rishra bustees. *Howrah.*—The Commissioners of this Municipality have now made arrangements for the preparation of plans and estimates of an approved scheme of water-supply in which the other riparian towns are to join. The preparation of the estimates, &c., are to be undertaken at a cost of Rs. 3,168 by Mr. Scott, Executive Engineer, whose services for this project have been lent by Government to the Municipality free of cost. *Rajshahye.*—Opportunity was taken, at the height of the flooding of the Ganges during the rainy season, to flush out the tanks and wells, and to wash out the drains and stagnant pools in the Beauleah and Nattore Municipalities, and thus a thorough cleansing was effected. The inhabitants of the villages in the neighbourhood of these water reservoirs availed themselves of the purer water thus secured, by cutting drains to various distances, and in some cases through public roads and embankments, to introduce the water into their tanks, which had dried up owing to the insufficient rainfall of the past three years. In the *Dacca* town, the further improvements to the filter beds, calculated to prevent leakage, were completed, and a tunnel giving access at all times (except during the highest floods) to the suction pipe was constructed. An out-house for the water-works, and a man-hole for the south tunnel, have also been constructed. The above works cost Rs. 3,656-6-9. Moreover, a boundary wall to the water-works premises has been erected at a cost of Rs. 987-2-6. The land required for building thereon additional settling tanks and filter beds, for the purpose of extending the water-supply, has been acquired and cleared of all huts and buildings. The munificent Nawab Assanoollah has, in commemoration of the visit to India of their Royal Highnesses the Duke and Duchess of Connaught, extended the water-works northwards up to Nawabpore road. The Nawab expended Rs. 11,000 on this work. The canal at *Sarun* was improved at a cost of Rs. 20,000. In the *Bhagulpore* town, the water-work project, referred to in the report of 1882, has been sanctioned by Government, and material and plant are being collected for carrying it out. The Government has lent the services of the Superintending Engineer and his subordinates for the undertaking, free of cost. The work, it is believed, will be completed within 14 months.

Tanks provided in special localities.

New tanks were excavated, and the existing ones either re-excavated, cleaned or improved, and the foul and stagnant ones filled up in the following Municipalities—

TOWNS.	DISTRICTS.	NO.	REMARKS.
Howrah	Howrah	2	One newly excavated, and one deepened and cleaned. River water was introduced into several tanks in the town.
Barrackpore	24-Pergunnahs	...	One channel to tank No. 1 excavated.
Busirhat	Ditto	1	Newly excavated.
Kishnaghur	Nuddea	...	Water from the river Jellinghi was brought into the chain of tanks in the bed of the original river.
Meherpore	Ditto	1	Newly excavated.
Moheshpur	Jessore	1	Ditto.
Pubna	Pubna	...	River water was introduced into several tanks in the town.
Manickgunge	Dacca	1	Re-excavated and extended.
Madaripore	Faridpur	1	Pucca ghat supplied.
Jamalpore	Mymensing	2	One newly excavated (1 in progress).
Sherpur	Ditto	1	Newly excavated.
Brahmanberia	Tipperah	2	Ditto (one in progress).
Chittagong	Chittagong	2	Springs for drinking water.
Arrah	Shahabad	1	Distributary channel.
Buxar	Ditto	1	Newly excavated.
Monghyr	Monghyr	1	Ditto.
Deoghur	Sonthal Pergunnahs	1	Re-excavated.
Cuttack	Cuttack	1	Newly excavated.
Puri	Puri	1	Cleaned and provided with an embankment and a sluice.
Hazaribagh	Hazaribagh	1	Pucca ghat constructed.
Ranchi	Lohardugga	1	Deepened.
Chaebassa	Singbhum	1	Deepened and cleaned.

Wells provided in special localities.

New wells were sunk, or the existing ones improved generally, &c., in the following Municipalities—

TOWNS.	DISTRICTS.	NO.	REMARKS.
Ranigunge	Burdwan	2	Sunk for pilgrims.
Soori	Birbhum	1	Sunk.
Midnapore	Midnapore	5	Re-excavated.
Kishnaghur	Nuddea	3	Sunk (masonry).
Bogra	Bogra	2	Kutcha, with masonry parapets, sunk.
Pubna	Pubna	1	Chain pump provided.
Serajgunge	Do.	3	Sunk.
Jamalpore	Mymensing	1	(In progress).
Sasseram	Shahabad	1	Sunk.
Rosserah	Durbhanga	Number not stated.	Fencing provided.
Revilgunge	Sarun	2	Sunk.
Sewan	Do.	16	Supplied with railing.
Jamalpore	Monghyr	3	Masonry sunk.
Ranigunge	Purneah	3	Ditto (1 in progress).
Sahebgunge	Sonthal Pergunnahs	1	Sunk.
Deoghur	Ditto	1	Do.
Cuttack	Cuttack	2	Do.

In Districts.

Rajshahye.—The mouth of the Narod river in this district, which had silted up, was excavated at a cost of Rs. 1,000, with a view to afford the people good water from the Ganges, and to inundate the bordering villages and the bhils situated within easy reach. The mouth of the Dhobapara khal, which joins the Hoja river with the Moishakhan river, and of two other water-ways, one through Putia thana and the other from Achintola, all of which had silted up, were opened. By this measure the annual flooding of the Moishakhan river was partially restored, and the stagnant Hoja, to which was ascribed the prevalence of the epidemic fever of a virulent and persistent type referred to in paragraph 129 of this report, was to some extent flushed. It is under consideration to deal with the Mudungachi

embankment, so as to enable the country to be flooded for the purpose of both irrigation and the cleaning out of tanks. The reports moreover show that Tanks and Wells were constructed in the following districts. Those provided by private individuals are distinguished from the others:—

Districts.	Localities.	Number of tanks or wells.	Cost.	Names of the private individuals at whose cost they were constructed.
			Rs	
Burdwan	In the localities in which distress, owing to diminished food supply from drought, prevailed, as relief works.	Some new tanks were excavated and some re-excavated.	9,175	
Birbhum	In the famine-stricken villages in thana Nulhati and Dubrajpur, as relief works.	10 tanks excavated ...	Not stated.	
Midnapore ...	In different places	12 ditto ..	5,750	By private individuals, names not furnished.
	In the Boloram Khas Mehal Estate	Some tanks and wells; number not stated.	1,403	Ditto ditto, ditto.
Hughli	Thana Kristonaggur	1 tank excavated ..	2,000	By Baboo Mohesh Chundra Mukerjee.
	Thana Singoor	1 ditto ...	1,000	By Baboo Shoshee Bhusan Bose.
	Mouzah Nobrna	1 ditto ...	468	
	In different places	11 ditto	1,200	By private individuals, names not furnished.
Nuddea	Not stated	1 ditto	800	
Rajshahye .. .	Ditto	52 ditto ...	Not stated	By zemindars and well-to-do ryots: names not furnished.
Pubna	Government estate Bonbaria in Serajgunge.	10 wells sunk	Ditto.	
	Maltinagar village in thana Raiganj.	1 tank excavated ...	500	By Khandkan Sarofbaks.
	Bakna village	1 ditto .	2,000	By Baboo Bhovrub Chander Tarafdar.
	Not stated	3 tanks re-excavated	Not stated	By the owners, names not furnished.
Faridpore ...	Bramhandi, Mirzapore, Bahadoorpur, Khalia, and Boalia villages.	6 tanks excavated ...	1,100	By private individuals, names not furnished.
	In different places	8 ditto ...	3,144	By the Road Cess Department and villagers.
Patna	Mahomedpur	1 pucca ghât to river	1,000	
Monghyr	Jamui sub-division	5 pucca wells sunk ...	Not stated.	
	Jamui bazar in Jamui sub-division	1 well sunk	Ditto	By Oshruf Bhagut.
	In Jamui sub-division	1 ditto	Ditto	By the Maharajah of Patsanda.
Bhagulpore .	Sudder sub-division	4 wells sunk	Ditto	
Purneah	Not stated	2 tanks and several wells.	4,642	By private individuals, names not furnished.
Maldah	Chanchal Estate and several other villages.	18 tanks excavated ...	13,134	
Sonthal Pergunnahs.	Dumka town	1 pucca well	Not stated	By Mr. Maling Grant, zemindar.
Puri	Mouzah Gopalipara	1 tank excavated ...	200	By Rohas Rowtra
	Ditto Bhobanessur	1 ditto ...	200	By Narayan Panda.
	Ditto Bolegurh	1 ditto ...	100	By Parshuram Dass.
	Ditto Kuspollah, Killa Khorda	1 pucca well sunk .	130	By Bimba Dhur Dass.
	Khorda Government Estate ...	Tanks and wells, number not stated.	Not stated.	

DISPOSAL OF THE DEAD

In Towns.

Burning ghats were provided in the *Baranagore* Municipality in the 24-Pergunnahs; back wall of the burning ghat at *Narainganje* in Dacca was raised; the construction of two godowns at the two burning ghats in *Bhagulpore* are in progress.

MARKETS AND SLAUGHTER-HOUSES

In Towns.

Markets.

The construction of the Chandai market in *Tumlook* in Midnapore, and a covered market in Darjiling are in progress. Improvements were effected to the Nuxulbari hat, the Garidhura bazar, and the Panighutta bazar in *Darjiling*. Buildings for the two bazars in *Aurungabad* in Gya; a wall for the compound of Gudree bazar in *Mozufferpore*; additional sheds to the market at *Madhubani* in Durbhunga; an iron-roofed market in *Dumka* in Sonthal Pergunnahs; and a range of shops and a shed for vegetable sellers at the market in *Purulia* were constructed. A commodious and substantial shed for the local market at *Manbhum* was put up by the zemindar of Jharia.

Slaughter-houses.

Wooden tables and blocks for cutting meat have been provided in the *Darjiling* slaughter-house. A pucca bone-pit at Malnachuck slaughter-house and new slaughter-houses at Hossainabad and Mirzatolla in *Bhagulpore* were constructed. The laying of stones on the floor of the Dobundha slaughter-house in *Cuttack* is in progress.

PROTECTION TO TRAVELLERS

In Towns.

A resting-house for travellers was constructed at *Silliguri* in Julpaiguri.

MEDICAL RELIEF

In Towns.

A cookshed for the indoor-patients at the *Tumluk* dispensary in Midnapore was constructed. Additions were made to the dispensaries at *Serampore* and *Barriepore*—the former in Hughli and the latter in 24-Pergunnahs district. One cook-house for the dispensary and one bungalow for the compounder were provided in *Dinajpur*. Cholera and small-pox sheds were constructed, and improvements made to the *Silliguri* dispensary in Julpaiguri. An outdoor dispensary in Nuxulbari in *Darjiling* was constructed. A cook-room for the dispensary at *Behar* in Patna was provided. An out-house in the dispensary and a house for the Assistant Surgeon were constructed in *Sasseram* in Shahabad. The latter is in progress. A shed for cholera patients in *Durbhunga* town and a cook-room and privy at the dispensary at *Roserah* in the Durbhunga district were constructed. A dispensary building in *Kissengunge* in Purneah is in progress.

The 25th June 1885.

R. LIDDERDALE, M.D.,

Deputy Surgeon-General,

Sanitary Commissioner for Bengal.

APPENDIX No. IV.

ABSTRACTS OF INSPECTION REPORTS ON TOWNS VISITED IN 1884.

Abstracts of Inspection Reports on Towns visited in 1884.

Soori.—*Inspected in January.*—The sanitary condition of this town was found to be very unsatisfactory, particularly in connection with conservancy, drainage and water-supply, and it appeared that very little progress had been made in improving its status since it was last inspected.

The recommendations were—(1) To allot a larger proportion than 3·7 per cent. of the income for the rectification of sanitary defects. (2) To administer the sanitary clauses of the municipal laws with greater closeness and activity than was being done. (3) To provide culverts to some of the village roads. (4) To prevent future encroachments over drains which were being made, although the existing encroachments (which were extensive) could not be removed, owing to no legal power to do so being conferred by the Municipal Act. (5) To lose no further time in undertaking to complete the long contemplated proposal of providing the town with a regular system of drainage with proper outfalls, as the existing drains were very faulty, and could not, from various causes, be kept in effectual working order. (6) To discontinue the present very objectionable mode of disposing the sweepings, conveying them outside the Municipality to be buried and left on the fields to rot for manure. (7) To treat similarly the litter and filth in the backs of houses, using wheelbarrows for their removal. (8) To have the slop and refuse water from houses collected in properly arranged gumlahs or catch-pans and removed in pails by the municipal mehters instead of permitting them to form unhealthy and unsightly nuisances. (9) To lower, if possible, the walls of the public latrines, as their being too high renders ventilation insufficient. (10) To provide each cell of the latrines with two tarred gumlahs, one for fœces and the other for urine and washings. (11) To keep the masonry work in the latrines in proper repair. (12) To provide conveniently situated additional public latrines, accessible to the people, in every part of the town, in the event of Major Ramsay's portable latrines (one of which is to be tried experimentally) not working satisfactorily. (13) To keep all public latrines scrupulously clean. (14) To induce the people to provide themselves with properly constructed latrines provided with gumlahs in place of the hollows in the ground which constitute the present latrines to the detriment of health. (15) To bury night-soil in shallow trenches one foot deep by one foot wide and cover it daily with earth instead of throwing it out of town, as it is not fair that the town should be relieved of one of its sources of sickness at the expense of the people living beyond its limits. (16) To provide a proper night-soil trenching ground. (17) To adequately strengthen the establishment and to provide additional carts, in order that the conservancy arrangements may be effectually carried out. (18) To properly trap the inlet to the tank reserved for drinking purposes, and to remove to another spot the school latrine, which is within six paces of this tank. (19) To sink a few wells in open spaces on fresh ground (not on old sites of houses) in the native quarter of the town. (20) To induce the owners to keep their wells in wholesome condition. (21) To close the Native Christian burial-ground, which is too near a jail tank from which drinking water is taken, and to open out another on a site further away from human habitations. (22) To cause the graves to be dug deeper than three-and-a-half feet, the graves of the Christians being dug six feet deep and those of the Mahomedans seven feet, as the latter generally place a bamboo or mat machan or roof over the body, which should be not less than four feet below the surface of the ground. (23) To establish proper burning grounds for the Hindus instead of permitting them to cremate their dead wherever they choose outside the Municipality. (24) To improve registration generally.

Action taken on the suggestions.—The night-soil trenching ground was selected as the most suitable site for removing the street sweepings to. It was considered impracticable and beyond the means of the Municipality to remove slop water in buckets, but it was decided to take measures to prevent its remaining stagnant. It was resolved to have the gumlahs and masonry of the public latrines tarred once a week, and that the sweepers should be held responsible for the proper use of the latrines. The proposition to lower the walls of the latrines by one foot to admit of ventilation was considered not feasible, as in this case the thatched roofs, which would have to be supported by bamboo props, may not weather strong gales; it was, consequently, decided to bore holes in the walls. It was considered impracticable to remove dung heaps from the town, on the grounds that the people, mostly agriculturists, would suffer loss by this measure, and the undertaking would be too costly to the Municipality. It was agreed to provide an additional cart, bullocks and an extra sweeper for the removal of stable litter. The question of undertaking the cleaning of private latrines and the remaining suggestion made in the Inspection Report were postponed for future consideration.

Sahibgunge.—*Inspected in January.*—This town was constituted a Municipality only two years ago, and owing to its favourable position it has become a large depôt for the exchange of traffic between the river and the rail. Its condition is not satisfactory; but the allotment last year of over 24 per cent. of the income for original sanitary works affords clear evidence that the sanitary welfare of the town is receiving commendable attention from the Commissioners. The drainage is being gradually improved.

The suggestions were—(1) To introduce at once those parts of the Municipal Act which provide for municipal taxation and contain important sanitary regulations, together with a revised Code of bye-laws. (2) To have the kutcha roads gradually metalled; (3) To remove some of the houses from the crowded portion of the town and to plant trees along the road sides. (4) To extend, as soon as possible, to the whole town the system of pucca shallow drains, which is most important in a sanitary point of view. (5) To persevere systematically with the filling up of unwholesome excavations, as they threaten to be a nuisance. (6) Not to permit the portable latrine to remain stationary as it tends to frustrate the purpose for which it was designed. It should be removed to a field behind the bazar and constantly moved on over trenches to be regularly dug and filled in. (7) To provide more latrines of a similar description, running on rails in the bazar, the neighbourhood of the market and in the cooly village to the south end of the Municipality, in which places they would prove very useful. (8) To provide ordinary latrines in places where the above kind of latrine cannot be used, so that promiscuous defœcation in the town by those who have no privies of their own may be effectually stopped. (9) To provide latrines for the exclusive use of females and to employ mehtranis only for these latrines. (10) To suppress entirely the sundasses or well-privies, notwithstanding that they are enclosed by walls and provided with roofs, as these arrangements do not prevent their being abominable nuisances, inasmuch as the filth in them being always in a state of fermentation, pollutes the air by evolving poisonous gases. (11) To induce the owners of those well-privies to provide themselves with properly constructed surface privies from which the night-soil could be properly and easily removed. (12) To introduce the system of having the private privies cleaned by municipal mehters, levying a fee for the service rendered, as experience everywhere shows that the employment of private mehters for this work has never proved satisfactory. (13) To instruct the police to detect those who commit nuisances about the town and have them prosecuted. (14) To bring into operation Part IX of the Municipal Act. (15) To establish under proper arrangements a municipal market and a slaughter-house. (16) To have some of the tanks re-excavated and reserved for drinking purposes. (17) To consider the advisability of establishing a charitable dispensary in the town, to be maintained by general subscription, as the need for it is specially indicated in this rising town. (18) To introduce Act IV (B.C.) of 1873, rendering the registration of births and deaths compulsory, and to have a separate record of the events kept and returns furnished to this office.

Action taken on the suggestions.—It was reported that the recommendations relating to latrines, water-supply and medical relief, to carry out which there are no funds at present, will be gradually given effect to.

Berhampore.—*Inspected in January.*—This Municipality was found to wear a better appearance in a sanitary point of view than when last inspected, and it was evident that the Vice-Chairman took an active and intelligent interest in its affairs. Many improvements were found to have been effected, the chief being the division of the town into wards and allotting them to the Commissioners for the purpose of their sanitary concerns being better looked after with the Vice-Chairman's active assistance; the strengthening of the conservancy establishment; the metalling of the roads; the proper utilization of the street sweepings; the improvement of the drainage; the better care and supervision of the latrines; the better trenching of night-soil and the providing of additional trenching grounds; the fixing of burning ghats at selected sites on the banks of the river; the appointment of two mohurirs to look after registration.

The recommendations were—(1) To remove the encroachments over the drains. (2) To use two gumlahs, one for fœces and the other for urine and washings, in each cell of the latrines and to tar them periodically. (3) To introduce experimentally Major Ramsay's land-manuring privies. (4) To prohibit the mehters to perform work on their own account. (5) To suppress well-privies which were supposed to exist. (6) To trench the night-soil properly and systematically, avoiding nuisance and offensiveness, so that native gentlemen may not be deterred from lending their gardens for trenching grounds (7) To extend the house-scavenging system, so that the cleansing of the remainder of the private privies might be undertaken by the municipal mehters. (8) To import mehters if they cannot be procured locally. (9) To clean the public and private privies twice a day instead of once. (10) To cause the floors of the two private slaughter-houses to be repaired and that of Rani Surnomoy's bazar cemented. (11) To close the Christian burial-ground against further interments, as it is crowded, and to burn the clothes and pillows of the Hindu dead instead of burying them in the dry bed of the river. (12) To fully utilize the provisions of the Compulsory Registration Act, and to adopt means to improve registration generally.

Action taken on the suggestions.—It was reported (1) That two gumlahs had been provided for each cell in the public latrines, which will be tarred periodically. (2) That one of Major Ramsay's moveable privies had been purchased, but that it is not much resorted to by the people. (3) That the mehters have been prohibited to do private work on their own account. (4) That every endeavour is made to suppress well-privies and improperly constructed privies. (5) That the system of trenching night-soil has been improved, in accordance with suggestions. (6) That additional mehters have been imported from the Sonthal Pergunnahs. (7) That every endeavour is being made to overcome the objection of the people to have their privies cleaned by Municipal mehters, and that for this purpose it is proposed to introduce Part IX of Act III of 1884 bearing on this subject.

Lalbagh or City Moorshidabad.—*Inspected in January.*—Although there is yet much to be done before the sanitary condition of this town can be pronounced to be satisfactory, there was evidence at my visit to show that the Commissioners were bestowing commendable interest on its sanitary welfare. A scheme, on an extensive scale, for remedying its defective drainage had been commenced. A fairly large tank had been excavated for the benefit of the people at Shahanagore, and a very unwholesome tank filled up. Additional public latrines and night-soil carts had been provided. The private graveyards had been reduced from 53 to 14, and the latter enclosed and registered. Two sites, 44 bighas in extent, were selected for the establishment of Municipal burial-grounds, and steps taken for acquiring the land under the Act. The large number of burning sites had been reduced to 7 public and 6 private ones, and these registered and placed in charge of Municipal domes.

The suggestions were—(1) To allot a larger share of the income for sanitary works, as the present apportionment, viz., about 15 per cent. of the income, did not appear to be an equitable one, considering that the income of the town is a large one and over Rs. 10,000 per annum has been set free by the Municipality having been relieved of police charges. (2) To fill up the excavations and the numerous unhealthy hollows, and to uproot the jungle abounding about the town. (3) To bring the drainage scheme to speedy completion, and to reconsider the arrangements connected with the Azimgunge drainage scheme, which is still very defective, as the outlet is non-effective and the passage of surface water and kitchen washings is impeded by an obstructed drain. (4) To prohibit the mehters to perform private work on their own account. (5) To prevent the heaping up of street sweepings and the promiscuous disposal of house refuse, and to utilize them systematically in filling up excavations, &c. (6) To provide a sufficient number of private latrines, particularly one at Baluchar, as the present number affects only one-fourth of the town; to afford more ventilation to the latrine at Lalbagh; and to cement the floors of the mat ones. (7) To dig the trenches only one foot wide by one foot deep, and to put in them only so much night-soil as will preclude its re-appearance on fermentation. (8) To suppress the sundasses or well-privies. (9) To have the private privies cleaned by Municipal mehters. (10) To provide a well-arranged slaughter-house and suitable places for the sale of meat, so that the objectionable butchers' shops about the town may be done away with, and, pending the carrying out of these arrangements, to properly drain the existing slaughter-houses, have their floors paved, and provide them with water. (11) With regard to the recently excavated tank near the thana and the well at Mongultoli, to remove the foul water before the rains set in and to make arrangements for protecting both tank and well from every pollution. (12) To prevent effectually the practice of defæcating on the banks of the ghats on the river. (13) To suppress entirely interments within the enclosures of houses as soon as the proposed burial-grounds have been established. (14) To utilize the provisions of the Compulsory Registration Act with full vigour, and to improve registration generally.

Action taken on the suggestions.—About five miles of the main road have been repaired. The Bhubantuli road, the side drains of which are dangerous, have been railed all throughout. The Katgola road-side drains are being filled up. The beds of the hollows within a short distance of the drains are being raised with street sweepings. The jungle on Municipal land, specially by the side of the drains, has been removed, and 119 notices been served on owners to remove jungle from their land. The drains at Azimgunge have been completed. Two thatched latrines have been constructed at Baluchar, and a pucca one is under construction; 14 holes have been made in the two sets of latrines for ventilation. Estimates of the cost have been framed for the construction of the Baluchar-Kannaiputti drain, and for the conversion of the Jamuleegurrah into a tank. The tank near Shahanagore has been cleaned and filled with river water and set aside for drinking purposes The Compulsory Registration Act is being fully utilized with the view of improving registration.

English Bazar Municipality.—*Inspected in January* 1884—Some reforms had been effected since this Municipality was last inspected, but very grave defects requiring urgent rectification yet exist.

Suggestions offered.—(1) To gradually fill up with street sweepings and rubbish the many hollows and disused tanks about the town, instead of accumulating them all over it, and to execute this work systematically, filling up one hole or excavation at a time and completing it before taking another in hand. (2) To prevent the further digging of holes and deepening of large excavations. (3) In constructing drains in future, to adopt shallow saucer-shaped ones, as notwithstanding several improvements that had been made in connection with the existing drains, they were found to be blocked throughout and in some places so deep as to act like elongated cesspools. (4) To strengthen the conservancy establishment, the existing one being quite inadequate for the requirements of the town. (5) To pay the establishment at higher than the present rates, which are not commensurate with the labour required from it. (6) To collect in vessels, for removal, the kitchen and slop water, or allow it to pass into the surface drains, instead of permitting it to form collections all over the town. (7) To remove the dead silk-worms and to construct proper drains in connection with the filatures for the removal of the water used in steeping cocoons, which is full of animal matter which on decomposition is very offensive. (8) To induce the people to collect their cattle dung near their mulberry fields instead of accumulating it in their houses to rot before removing it to the fields. (9) To provide public latrines and to prevent the practice of general defæcation close to houses and elsewhere, suggestions which have been often urged on the Commissioners without effect. (10) Before

providing these conveniences to give a trial to one of Major Ramsay's portable privies which, if successful, will save the cost of constructing public latrines and obviate the necessity of providing ground for trenching the night-soil. (11) To see to the proper cleansing of the private privies, compelling the people to have them attended to daily and prosecuting those who keep them in a filthy condition, or better still causing them to be cleaned by the Municipal mehters under Municipal supervision. (12) To suppress the well-privies, which are suspected to exist yet. (13) To insist on the night-soil from the private latrines being trenched in suitable grounds beyond the limits of the Municipality. (14) As owing to the scarcity of rainfall the tanks were drying up, and, consequently, contained water unfit for any purpose, to take the opportunity of improving as many of them as possible, by having their sides thoroughly cleaned of rubbish, their bottoms scraped to the depth of a foot or more and the *debris* removed, and if water is to be admitted to them from the river, to have the connecting channels carefully cleaned both by removal of rubbish and flushing. (15) Before digging more tanks to consider whether tanks are so useful as to justify the expenditure of much money on them, as they do not appear to retain water on account of the sandy subsoil. (16) To stop without delay interments in the compounds of houses. (17) To provide conveniently situated burial-grounds, as the two existing ones cannot be easily resorted to and kept in good condition, owing to one being in the north of the town and the other six miles away from the station. (18) To prevent the domes appropriating to themselves the clothes and pillows of those who die from infectious diseases. (19) To consider the advisability of dismissing the vaccinator of Mukdompur if he does not improve the quality of his work. (20) To utilize fully the provisions of the Compulsory Registration Act and to improve registration generally.

Action taken on the suggestions.—It was reported that the conservancy establishment had been doubled; that steps had been taken to improve and maintain the drainage and water-supply in all parts of the town, to fill up holes, remove rubbish heaps, to clear away jungle for ventilation, to close offensive privies, and to provide latrines; that constant attention had been enjoined with regard to matters of conservancy and sanitation; that several sanitary works had been executed during 1st April to 31st October 1884 at a cost of Rs. 3,456-12-9; and that a list of more works of this nature had been prepared, some of which were being carried out and the rest were to be taken up as soon as the budget allotments provided for them became available.

Old Maldah.—*Inspected in January.*—This town was found to have maintained the very insanitary conditions of former years, which, added to the waterlogged condition of the place, are said to engender malarious fever and to set free the germs of other diseases, so that many people had deserted their dwellings and trade was in a paralysed state. In fact it appeared that the town was progressing in decay. Want of funds no doubt hampered the Commissioners in effecting any substantial improvement. The drainage was still defective, notwithstanding some improvements that had been made; the conservancy arrangements continued in the same disgraceful condition as seen at the last inspection in February 1881; the arrangements for the disposal of the dead as far as burial was concerned were most objectionable; and the Mahomedans continued to bury their dead in the gardens or in open grounds at a little distance from the dwelling-houses, for want of a public burial-ground.

The suggestions were—(1) To employ systematically in effecting sanitary improvements the saving effected by the Municipality having been relieved of the cost of maintaining the police. (2) To prevent the irregular construction and crowding together of houses without any provision for free ventilation. (3) To remedy as soon as possible the defects in connection with the practice of steeping bamboos and throwing house refuse and filth in the large depressions in the low grounds left between houses that are irregularly built in rows on high strips of land. (4) To strengthen materially the conservancy establishment for keeping the town clean, and to provide one or two rubbish carts. (5) To excavate the large depression between Mokatipur and Farizpur, into which many privies discharge their contents, and which is so blocked that nothing can flow away. (6) To take such levels as will admit of the water from the bath-rooms and kitchens running off. (7) To have the night-soil removed by the householders or by the Municipality at their expense. (8) To rectify, in the manner suggested in the inspection report of August 1879, the grave defects under the head of conservancy. (9) To take better care of the tanks that are reserved for drinking and other domestic purposes. (10) To establish a public burial-ground for the Mahomedans and to close gradually the private burial places. (11) To place vaccination under the supervision of the Civil Hospital Assistant. (12) To fully utilize the provisions of the Compulsory Registration Act IV (B.C.) of 1873, and not to permit it to remain any longer a dead letter; to appoint a person to detect all evasions of the requirements of the law, and have the delinquents punished; and to deal with the constables or chowkidars under section 6 of the Act whenever they omit to report the events occurring in their beats.

Action taken on the suggestions.—The Magistrate reported that the conservancy establishment had been considerably increased, and that he had drawn the attention of the Municipal Commissioners to the sanitary clauses of the bye-laws, which were somewhat overlooked, and to various other matters; and that the Commissioners were anxious to recognize their responsibilities.

Bhagulpore.—*Inspected in January.*— Since this town was last visited much has been done to improve its sanitation, and its present condition contrasts very favourably with its state

a few years back, when very grave defects existed under every head of sanitation. It has the advantage of a good natural drainage; the conservancy arrangements are fairly satisfactory; the project for providing filtered water for the town, the supply being taken from the river Ganges, has been sanctioned by Government, and the work will soon be taken in hand, and completed, it is hoped, in about 14 months; 66 private Mahomedan burial-grounds have been registered; and three sites about 30 bighas in extent have been acquired by the Municipality and set apart for the burial of the Mahomedan dead. All these bear evidence that the Commissioners are not unmindful of the sanitary welfare of the town. But its condition is not yet quite satisfactory. Many defects yet call for rectification.

The suggestions were—(1) To assign a larger portion of the income for improving the sanitation of the town, the present apportionment of about 10 per cent. not being equitable, considering that the large sum of about Rs. 9,000 a year accrues to it owing to its having been relieved of police charges. (2) To consider carefully the question of the irregular laying out and construction of houses without proper provision for ventilation or any drainage arrangement, and to bring into operation those sections of the Municipal Act which relate to "building regulations." (3) To prevent the excavation of holes for taking earth for building purposes. (5) To demolish the deep pucca drain at Soojagunge and have it replaced by shallow surface ones, when the scheme for a complete set of surface drains for Soojagunge, which has received the approval of Government, and for which funds have been supplied to the Public Works Department, is undertaken, and at the same time to demolish the kutcha drains, which are irregular in level in several places. (6) To prevent the practice of throwing the kitchen refuse on roads and elsewhere, having it removed by mehters to the trenching ground. (7) To have the privies which are exposed to public view shut out. (8) To suppress the well-privies and other objectionable description of privies in Moula chuck. (9) To take early steps to extend Part IX of the Municipal Act relating to latrines to the rest of the town. (10) To require Baboo Giridhary Sahoo to have the floor of his market paved. (11) To have the offal and garbage from the slaughter-house buried in the trenching ground instead of throwing them into the Teen Foolka river. (12) To have the floor of the slaughter-houses made pucca and cemented. (13) To have the filtered water-supply scheme, which has been approved by Government, speedily brought to completion. (14) In view of economy of space, to have the graves in the Moula chuck burial-ground dug in rows and not at random, and to make arrangements for the burial of children in a separate row. (15) To have the private graveyards of the Mahomedans closed, as each becomes crowded or falls into decay, since public burial grounds have been provided for them. (16) To take steps to have the village of Rampoora incorporated with the Municipality. (17) To have a registrar attached to the Berari burning ghat, who shall keep a record of corpses brought to it for cremation, as is done in the burning ghats in Calcutta. (18) To prohibit the throwing of half-burnt bodies into the river; to have the Hindu pauper dead cremated at the cost of the Municipality instead of being thrown into the river; and not to allow the domes to take away the clothes and pillows of the dead, which should be burnt. (19) To take steps for the vigorous application of the provisions of the Compulsory Vaccination Act. (20) To exert to the utmost to place registration on a satisfactory footing; to appoint a person to detect and report all evasions of the requirements of the Compulsory Registration law, and to deal with the constables and chowkidars under section 6 of that Act for omission to report births and deaths.

Action taken on the suggestions.—It was reported that several of the suggestions had been adopted, and that the rest were under consideration.

Purneah Municipality.—*Inspected in January.*—Commendable sanitary improvements were found to have been effected in this town since it was last inspected. Sixteen public latrines (8 for males and 8 for females) and one urinal had been erected; night-soil carts provided; saucer-shaped drains on each side of the main streets constructed in the place of the existing square drains, wells and tanks had been cleared, and other improvements had been or were contemplated to be effected. But several serious defects still existed, particularly under the heads of Conservancy and Drainage, which called for urgent reform.

The suggestions were—(1) To metal the kutcha roads, as owing to the sandy nature of the soil they require constant attention. (2) To move Government to have a survey made of the undrained swamps around, and interspersed in, the old station to see if no outlet can be obtained for the vast amount of water stagnating on the surface in bhils or old channels, or whether by connecting these by channels it would not be possible to carry off the water more rapidly and so diminish the evil of the long-continued drying up. (3) To correct certain defects discovered in the new saucer drains above alluded to. (4) To prevent people from allowing sewage from their houses to pass into these drains. (5) To strengthen the conservancy establishment. (6) To carry out surface-cleansing more completely, as at present the streets and drains of only that portion of the Municipality which lies on both sides of the bazar road are attended to. (7) To utilize the street sweepings more systematically than at present, filling up one or two excavations to completion before undertaking the filling up of others. (8) To enquire into the objections of the people to resort to the public latrines, and to make every endeavour to overcome them. (9) To provide more public latrines, but before doing so to give a fair trial to one of Major Ramsay's portable latrine and if it answers the purpose, to introduce an adequate number of them. (10) To have people committing nuisances about town prosecuted, after providing them with trenches dug in the fields at a distance from habitations, pending the provision of public latrines. (11) To

give effect to the law on the subject of latrines, which has been introduced into the town, meeting the difficulty of obtaining mehters locally by importing them from elsewhere. (12) To prevent the spill water from the public wells being dammed up, sinking into the ground, and re-entering the wells, collecting it in troughs if required to water the streets. (13) To induce the owners of the private wells to get rid of the unwholesome water in them. (14) To burn the clothes and pillows of the Hindu dead instead of allowing the domes to appropriate them, as they form vehicles of contagion. (15) To bury dead animals instead of throwing them away. (16) To compel the objectors to submit to vaccination by enforcing in their cases the provisions of the compulsory law. (16) To utilize fully the provisions of the Compulsory Registration Act and to adopt means for the improvement of registration generally.

Action taken on the suggestions.—It was resolved, (1) To direct the Overseer to bring up for punishment all parties committing nuisances. (2) To remedy the defects connected with the city drains, to provide a conservancy cart, and one or more public latrines in Khaganchihat and in the city, and to prosecute those who do not use them. (4) To endeavour again to procure sweepers for the working of the law relating to latrines. (5) To carry out the suggestions regarding the Government and Municipal wells. (6) To adopt measures for the enforcement of the Compulsory Vaccination and Registration Acts.

Burdwan.—*Inspected in February.*—The sanitary arrangements of this town, specially those under the heads of conservancy and water-supply were excellent. There was sufficient evidence to show that the Commissioners were taking commendable interest in improving its sanitation. It is to be regretted, however, that the drainage arrangements were not satisfactory; but it appeared that the Commissioners were not able to undertake a drainage scheme until the water-works scheme then in hand had been completed.

The suggestions were—(1) To bring into operation in this important town all the parts of the new Municipal Act III (B.C.) of 1884, particularly Part IX. (2) Until a proper drainage scheme could be introduced, to bestow more constant attention to the existing drains than is paid to them at present. (3) Not to lose sight of the great necessity of extending the commendable latrine system to the rest of the town not yet supplied with public latrines. (4) To require the police to pay strictest attention to the commission of nuisances about town and to bring up for punishment the offenders. (5) To utilize properly the sweepings of the town in filling up tanks and hollows, and to fill up at once the corner furthest from the Rajbari used as a privy and for casting night-soil. (6) To remedy the defects in connection with the system of trenching night-soil. (7) To open another trenching ground, as the present one is not conveniently situated with reference to the blocks of privies from which night-soil is removed to the trenching ground. (8) To require the owner of the private slaughter-house to keep it clean and in good order. (9) To consider the advisability of establishing a properly constructed slaughter-house. (10) To fill up the foul tanks about the town as expeditiously as possible after the water-works are opened, in order that the full benefits of the excellent filtered water service may be enjoyed by the people. (11) To remedy the defects in connection with the dilapidated condition of the posts and rails of the tank at the entrance of the jail. (12) To discontinue the use of the cemetery attached to Pir Baharim, which is nearly crowded and is situated too much within the town. (13) Not to permit the objectionable practices of cremation on the sands of the river Damuda, and the throwing of dead animals on its banks. (14) To consider whether another vaccinator should not be entertained, as the single vaccinator employed is not sufficient for the requirements of the town. (15) To carry on vaccine operation actively in the cold season in future instead of in the hot weather. (16) To utilize fully the provisions of the Compulsory Registration Act, and to adopt measures for the improvement of registration generally.

Action taken on the suggestions.—It was reported (1) That cleanliness of the drains was being attended to. (2) That the attention of the District Superintendent of Police had been drawn to the subject of putting down promiscuous defœcation. (3) That endeavours were being made to utilize town sweepings in filling holes and hollows in the best way practicable. (4) That suggestions regarding the mode of trenching night-soil had been negatived on the ground that they were found almost impracticable, and that the endeavours to induce people to use night-soil for manuring purposes had failed. (5) That efforts were being made to procure more land for the trenching of night-soil. (6) That suggestion regarding the establishment of a slaughter-house will be taken in hand as soon as funds are available. (7) That with regard to the recommendations about the disposal of the dead, the Commissioners intend to take the matter in hand very soon.

Patna.—*Inspected in February.*—The sanitary condition of this large town was not satisfactory, and many reforms were called for in it. The drainage was more or less defective, but a beginning had been made for providing most of the roads with pucca saucer drains, and endeavours were being made to improve otherwise matters in this direction. The arrangements regarding conservancy and supply of drinking water, as far as public wells are concerned, were very unsatisfactory. Some of the arrangements for the disposal of the dead were most objectionable, and no improvement had been effected in this direction since the last inspection in 1883. There was not a single public burial-ground either for Mahomedans or Christians.

The suggestions were—(1) To devote, for improving the sanitary status of the town, in addition to the share of the income to which sanitation is entitled, the major portion of the

amount set free by the Municipality having been relieved of police charges, which amounted to over Rs. 26,000 per annum, and to utilize a portion of the unnecessarily large closing balances for the same purpose. (2) To display more activity and closeness in administering the sanitary clauses of the municipal laws and bye-laws, so that the sanitary welfare of the town may be materially benefited. (3) To have the city dispensary thoroughly repaired. (4) To put a stop to the practice of taking earth from the old town moat for brick and tile making, the result of this procedure being that there is now running through the town an immense ditch made up of deep detached holes, which are full of stagnant water. (5) To bring to speedy completion the work of providing the roads with pucca saucer drains and to make a proper survey of all those mohullahs which cannot be drained as easily as Mirzaigunge, owing to difficulties connected with outfall, in order to ascertain in which direction the surface drainage should be carried, so that it may find exit at all seasons. (6) To remedy the defects connected with the new saucer drains above alluded to, as the connection between the bath-rooms and the drains is rather imperfect, the result being that soakage occurs close to the walls of the houses. (7) To prohibit the conservancy staff from performing private work on their own account. (8) To provide more public latrines at convenient places, and the present ones with gumlahs for washings in order to obviate the spilling of water, which makes the floor wet and does away with the beneficial effect of the dry-earth system. (9) To take steps to suppress the well privies without delay. (10) To extend the Act relating to latrines to all those parts of the town where it is not in force. (11) To strengthen the conservancy estabshment generally, as the present staff is found to be insufficient for the requirements of the town. (12) To take up more ground for trenching the night-soil. (13) To conduct the trenching system on a better and less objectionable plan than that at present followed. (14) To cultivate regularly the trenching grounds. (15) To introduce Major Ramsay's land-manuring latrines on lands that are regularly cultivated, otherwise the scheme will lead to a further deterioration of the site of the town. (16) To establish two Municipal slaughter-houses. (17) To take early steps to prevent the practice of throwing dead bodies into the river. (18) To establish a general burial-ground in order to do away gradually with the numerous (525) most objectionable private burial places within the compounds of houses. (19) To have the pauper dead buried at the cost of the municipality and not thrown away, as is at present done, a pernicious and barbarous practice. (20) To take steps to prevent partially cremated bodies being cast into the river. (21) To bring into operation the Compulsory Vaccination Act, and to endeavour to find out the ex-inoculators who practice inoculation, who should, whenever detected, be prosecuted and their vaccination licenses revoked. (22) To pay particular attention to remedying the grave defects in connection with the registration of births and deaths. (23) To extend to the whole district the beat system, under which constables or chowkidars are held responsible for reporting all births and deaths occurring in their beats, and to make proper arrangements for the supervision of the work. (24) To fully utilize in the town the provisions of the Compulsory Registration Act, to appoint a person specially to detect all evasions of the provisions of this law, and to apply to the chowkidars and constables section 6 thereof for omitting to report the events occurring in their beats.

Action taken on suggestions.—It was reported (1) that brick-making in the city moat has been stopped; (2) that additional land south of the trenching ground at Ranipur, had been rented and brought into use; (3) that burning of night-soil near the Kowa Khoh has been stopped, the night-soil being carted to Sharifganj and trenched there; (4) that additional Ramsay's latrines had been provided, new trenching grounds for them taken up, and that, when manured, the grounds are to be handed over for cultivation; (5) that arrangements had been made to close the sundasses whenever they can be replaced by public latrines or privies served by Municipal mehters, and that no new wells will be allowed to be excavated near sundasses in private dwellings or elsewhere; (6) that the employment of Municipal servants by private persons has been prohibited; (7) that four new public latrines are to be constructed as soon as the required land for this purpose can be acquired.

Gya.—*Inspected in February.*—The sanitary status of this town had not, it was observed in any way improved since it was last visited in January 1881. There was the fullest evidence of complete neglect in every department of sanitation. The establishment maintained for sanitary purposes was very badly worked, and perfunctory performance of duty was only too manifest. The want of almost all supervision over conservancy was what struck me most, everything being mismanaged or neglected.

The suggestions were—(1) To devote annually an adequate share of the income for improving the sanitation of the town. (2) To administer vigorously the sanitary clauses of the Municipal law and bye-laws. (3) To put a stop to the destruction and causing of damage to the peepul trees on the roadside of the station. (4) To see that the drains are made effective for their purpose, and to prohibit encroachments over, and deposits on the kutcha ones, which cause obstruction and involve heavy expenditure for repairs. (5) To push on to a conclusion, as quickly as possible, the inquiry into the objections raised against the new drainage scheme being taken in hand. (6) To curtail as much as possible the system of covered sewers in the old town, and to substitute for the present ones in the most narrow lanes central pucca drains. (7) To take precautions with regard to the circumstance that in some instances in constructing the new open side drains the ends of the old covered ones have been blocked so as to leave no outlet, which will soon lead to a number of intolerable nuisances. (8) To take steps for the prevention of night-soil finding its way directly from

houses into the drains, and for its removal by other means. (9) To make the conservancy establishment perform their duties efficiently and fully, and to compel the supervising staff to closely watch the under-men and see that they do so. (10) To frame a set of rules providing for the efficient maintenance of general conservancy, the proper cleansing of latrines, both public and private, and for the punishment of delinquents for neglect, remissness, evasions of duty, &c., and to hold the Secretary responsible for the proper observance of the rules. (11) To prohibit the conservancy staff from performing private work on their own account. (12) To have the lanes and bye-paths swept and cleaned, wheel barrows being used where carts cannot obtain entry. (13) To dispose of and utilize properly street sweepings, rubbish, &c., only such a number of excavations or hollows being taken up at one time to fill up which there are sufficient sweepings. (14) To have the sweepings, &c, of the old town removed in hand-barrows and placed in the bed of the Kharwa nullah. (15) To take steps to have house and kitchen refuse, fluid and solid, and the refuse from the rear of houses buried, in the trenching ground. (16) To have the private latrines more carefully looked after, properly managed, and kept thoroughly clean. (17) To provide two gumlahs for each cell in every latrine, one for fœces and the other for washings, and to have the gumlah for fœces charged with dry earth, which should be kept in the cells conveniently at hand. (18) To select other sites than the dry bed of the river Phalgoo for temporary latrines. (19) To provide more public latrines, particularly in localities where there are none, but giving a trial to one of Major Ramsay's patent portable latrines, before constructing them. (20) To compel those who have no private privies of their own to use the public ones, so that the abominable practice of defœcating all over the town might be effectually stopped. (21) To have the latrines for the use of the females entirely separate from those for males. (22) To re-introduce the Latrine Act (now Part IX of the Municipal Act of 1884), and to enforce its provisions vigorously and in the manner in which they are worked in other towns, particularly in Howrah and Serampore. (23) To induce the people to give up their roof and verandah privies, as they will always object to the Municipal servants having access to them, and in their stead to construct privies on the ground floor on arched recesses, sufficiently roomy for the reception of the gumlahs, for the entry of mehters to remove them, and for the Municipal servants to see to the cleanliness of the privies. (24) To carry out the system of trenching night-soil more properly than it is at present done, adopting for this purpose the plan followed in Monghyr. (25) To make the police detect the commission of nuisances in houses or about the town, and prosecute all offenders. (26) To stop the objectionable practice of resorting to the river for purposes of nature, providing a properly constructed latrine on its bank. (27) To take steps to remedy the evil in connection with the conservancy of the market called Purana Godown, arising from the narrow streets of the market being blocked from early morning by carts and bullocks. (28) To put a stop to the objectionable practice of burying the bones from the private slaughter-house in pits close to it. (29) To prevent the practice (due to the want of a piece of piping) of transferring water after it had been pumped up from one of the public wells, to the watering carts by men with gurrahs, which process simply doubles expense. (30) To take steps to close the the Mahomedan burial-ground, which is crowded, and to provide one if the Mahomedan community are unable to establish any for themselves by subscriptions. (31) Not to permit the burial of the Mahomedan pauper dead in the dry bed of the river Phalgoo. (32) To put a stop to the practice of burying in places other than the burial-ground, and to cause the dead to be buried at a greater depth than four to five feet to admit of the chupper which is usually placed over the body being not less than four feet below the surface level. (33) To put a stop to the objectionable practice of cremating bodies in the dry bed of the river Phalgoo, to appoint ghats on its banks for the purpose, to limit all cremation to them, and to prevent the practice of throwing dead bodies of men and animals into the river. (34) To fully utilize the provisions of the Compulsory Registration Act, and to adopt measures for the improvement of registration generally.

Action taken on the suggestions.—(1) Measures have been adopted for the proper conservancy of the town; for the daily sweeping of the streets, roads and lanes; and for properly utilizing the sweepings and rubbish in filling up ditches and hollows. (2) Provision will be made in the next budget for a number of wheel barrows. (3) Arrangements have been made for the proper supervision of the conservancy establishment. (4) Arrangements will also be made for providing a separate gumlah in each cell of the public latrines for the washings. (5) A trial is being given to two of Major Ramsay's patent portable latrines. (6) Regarding the suggestion that police officers should be made to detect all offenders committing nuisances about the town, the Commissioners are of opinion that this is very much needed. (7) Arrangements have been made for having the female latrines separate from those for males, by constructing a partition wall separating the male and female compartments of the present public latrines. (8) Arrangements have also been made for carrying out the system of trenching night-soil in a proper and inoffensive way. (9) Regarding the suggestion to keep the private privies clean and sweet, the Commissioners say that, although the Latrine Act was not in force, the private mehters and mehtranis have been brought under the control of the Municipality since the introduction of a new trenching system, and that they have been conveying all night-soil to the trenching grounds. (10) They are also of opinion that to remedy the evil concerning the defective construction and to provide for the cleaning of the private privies, there should be a bye-law compelling all owners or occupiers to remodel the shape of their privies and to provide such privies as

have been recommended by the Sanitary Commissioner, and that the introduction of the Latrine Act and the enforcement of its provisions are absolutely necessary. (11) Regarding the suggestion about the streets in the market called Purana Godown being blocked from early morning by carts and bullocks, thereby precluding the conservancy of the place being attended to, steps in the way of prosecutions have been taken to remove the evil. (12) The owner of the private slaughter-house has been ordered to put a stop to the burying of the bones in pits close to houses. (13) The Commissioners are of opinion that a new burial-ground for the Mahomedans is urgently needed, as the present one is much crowded, and that a new place should be selected and provided for; and that with regard to the suggestion to provide burning ghats on the banks of the river and prohibit cremation in the dry bed of the stream, some convenient ghats for the cremation of the Hindu dead on the banks of the river should be selected.

Arrah.—*Inspected in February.*—Many sanitary defects were found in this town in urgent need of rectification. The drainage arrangements were very defective, and very little improvement had been effected with regard to conservancy since the town was last visited: in fact the arrangements under this head were still very unsatisfactory. Attempts were being made to improve the water-supply, and for this purpose a channel was being cut for introducing canal water into some of the principal tanks. There was evidence, on the whole, indicating that the Commissioners were not taking sufficient interest in the sanitary welfare of the town; but the great obstacle to progress in sanitation was said to be want of funds.

The suggestions were—(1) To give earnest attention to the means by which funds may be forthcoming, as they are urgently needed for the correction of defects under several heads of sanitation. (2) To devote annually a legitimate share of the income in improving the sanitation of the town, agreeably to the orders of Government on the subject when relieving the Municipality of police charges. (3) To attend to the observations on the subject of introducing the Latrine Act (now Part IX of the Bengal Municipal Act, 1884) made in the last Inspection Report. (4) To prohibit strictly the making of excavations for taking earth for building purposes, and to fill up the present ones as fast as practicable. (5) Pending the carrying out of the contemplated scheme of substituting pucca drains for the present kutcha ones, to endeavour to keep the latter in proper working order. (6) In carrying out this scheme to attend to the other defects noticed under head drainage, and to have saucer-shaped drains, connecting them with the houses, so that they may carry off the bath and slop water. (8) To increase adequately the conservancy establishment, so that the entire requirements of the town may be efficiently attended to. (9) To utilize the street sweepings, &c., in filling up hollows *within* the town and not those that are *out* of town. (10) To have the lanes and the outlying portions of the Municipality regularly swept. (11) To give a trial to Major Ramsay's portable latrines before constructing the ordinary ones. (12 To provide more public latrines, particularly for males, and in constructing them to consider the advisability of having them made of corrugated iron, which are cheaper and easily kept clean. (13) To have the drains and the walls of the public latrines to the height of three feet from the floor tarred periodically. (14) To put down promiscuous defœcation, and to make the police arrest and bring up the offenders for punishment, and until more private latrines are supplied, to provide trench latrines in appropriate places for those who have no privies of their own. (15) To manage the school latrine properly and to provide it with gumlahs. (16) To replace the present covered urinals by curved sheets of tarred iron partially surrounding pucca drains leading to pucca receptacles holding buckets. (17) To carry out the system of trenching night-soil properly, and to try to induce the cultivators to lend for trenching purposes their lands, situated near public latrines, when they go out of cultivation. (18) Not to give up the suppression of the well-privies, as they are abominable nuisances, and to induce their owners to provide themselves with properly constructed surface privies. (19) To have the private privies cleaned by the Municipal mehters under Municipal control. (20) To have the flooring of the Municipal slaughter-house properly cemented, to prevent soakage, and to levy a fee for slaughtering cattle in it, so that the initial and current expenditure incurred may be recouped. (21) To consider the suggestion of the Civil Surgeon to construct a new pucca meat market. (22) To construct catch water drains around the remaining private and public wells. (23) To give effect to the recommendation of the Civil Surgeon to provide all public wells with pumps worked by *bhisters* of proper caste and with service reservoirs with taps from which people might take their water. (24) To consider the suggestions made in the last Inspection Report under the head of water-supply. (25) To induce the Mahomedans to dig the graves for their dead six feet deep, so that the chupper usually placed over the corpse may lie at least four feet from the ground surface. (26) To enquire whether interments are carried on within the enclosures of houses, and, if the practice is found to exist, to forbid it. (27) To encourage the trade in firewood from the hills in the south of the district through the canals and the Sone river, so that the great scarcity of fuel for the burning of corpses may be obviated. (28) To bring into operation the Compulsory Vaccination Act. (29) To take into consideration the subject of providing accommodation for the houseless poor and the aged, as soon as funds are available. (30) To carry out the sanitary arrangements needed in the Opium weighing sheds, particularly with respect to drainage and latrines. (31) To attend to the insanitary condition of the Aburpool, Milkie, Puckrie, and Anaith bustees or mohullahs, arising from the houses being low-built, ill-ventilated, and very much crowded. (32) To utilize fully the provisions of the Compulsory Registration Act, and to adopt measures for the improvement of registration generally.

Action taken on the suggestions.—(1) It was reported that the suggestions regarding the introduction of the Latrine Act will be laid before the next meeting of the Municipal Commissioners. (2) That four more latrines will be constructed on appropriate sites, and a reminder will be sent to the Collector with regard to taking steps for the final acquisition of land required for the purpose. (3) That two more sites suitable for the employment of Major Ramsay's moveable latrines will be selected, and the Collector will be moved to acquire the land chosen for the purpose. (4) That licenses for private markets will not be granted unless the provisions of section 306 of the Municipal Act be strictly complied with. (5) That in future no license will be granted for lime or brick-kilns unless they are situated on free and open spaces, and, as far as possible, without the Municipal limits. (6) That certain public wells will be set apart for drinking purposes only, and that bathing or washing clothes on or near the platforms surrounding the wells will be strictly prohibited. (7) That sloping platforms for carrying off surface water will be made or repaired in the case of each of the wells so reserved for drinking purposes. (8) That the suggestion regarding the introduction of the Compulsory Vaccination Act will be laid before the Commissioners at their next meeting. (9) That the provisions of the Compulsory Registration Act will be, as far as possible, promulgated among the inhabitants and utilized by the authorities.

Mozufferpore.—*Inspected in February.*—The sanitary arrangements of this town were not found quite satisfactory, many grave sanitary defects still existing, particularly under the heads of conservancy, water-supply, and drainage. With regard to the last, however, levels were being taken with the view to improve it.

The suggestions were:—(1) To endeavour to have the revenue of the Municipality increased by raising taxation, as the incidence of income to population is lower than in several other Municipalities containing an equal or even a smaller population. (2) To assign annually, for sanitary improvements, a legitimate portion of the income of the town, as well as the major share of the amount set free by the Municipality having been relieved of police charges. (3) To provide gradually all the principal streets with pucca saucer drains, and to connect them with wells and the bath-rooms of houses to carry off spill and bath-water. (4) To prevent further encroachments over drains, as the passages under them are used for casting rubbish, &c., which cause obstructions to the drains. (5) To require all persons wishing to have a way made for entry into their houses to provide drain pipes of sufficient size to allow free passage of water through the drains beneath, instead of filling them up with earth. (6) Not to allow the house drains into which kitchen refuse, &c., are cast to empty themselves into cesspools close to houses (7) To consider the question of increasing the pay of the conservancy establishment, as their present allowances are insufficient, leading them to perform their work perfunctorily. (8) To have all the roads and lanes swept daily and to provide more carts for removing the sweepings, &c., hand-barrows being used in those lanes to which the carts cannot have access. (9) To provide more latrines, specially in mohullahs Chandwara and Sadparah, where there are none. (10) To have the latrines for females entirely separate from those for males, and to appoint mehtranis only to attend to them. (11) In constructing latrines in future to avoid the high cost which was incurred in building the existing ones. (12) To bring into use experimentally one or two of Major Ramsay's portable latrines, as they have been proved to be very useful, comparatively less expensive, and more suited to the habits of the people than the regular latrines, and to consider the advisability of bringing into use the new corrugated iron latrines, Hornbury's patent, sold by Messrs. Burn & Co., placing them on properly cemented platforms. (13) To have the seats and drains of all the public latrines made of the best pucca masonry plastered with Portland cement. To prevent the soakage to which they are at present subjected. (14) To have the drains and walls of the latrines periodically tarred; the latter up to three feet high. (15) To provide all the latrines with pucca washing places outside and to direct the people to use them, so that the dry-earth system can be carried out properly. (16) To rectify the defects existing at No. 1, Municipal market latrine. (17) To have the private privies attended to by Municipal mehters under Municipal control, and to bring into operation Part IX of Act III (B.C.) of 1884. (18) To suppress at once the remaining well-privies. (19) To strictly prohibit promiscuous defæcation as soon as a sufficient number of latrines is provided. (20) To open some more trenching grounds, as the present ones are not conveniently situated with reference to the night-soil depôts, and to induce owners of fields in proximity to latrines to make them over to be manured. (21) To provide a latrine for the Municipal market, and to require the owners of the private markets to do the same, and also to rectify the defects noticed with regard to them. (22) To consider the question of establishing a properly constructed Municipal slaughter-house, with all the needful appliances for carrying on the work. (23) To build a pucca connection between the Gunduck river and the larger tanks which are resorted to for drinking purposes. (24) To have the broken parapets of some of the public wells repaired. (25) To supply the wells, as well as the large tank in front of the Municipal shed, with pumps to enable the people to raise water from the former, and to fill the water-carts from the latter. (26) Not to permit the domes to appropriate to themselves the clothes and pillows of the Hindu dead, as they form potent vehicles for the spread of contagious diseases. (27) To bring into operation the Compulsory Vaccination Act. (28) To adopt the hath-chitti or hand-book system in every registering circle of the district, and to institute inquiries systematically regarding the occurrence of deaths in the villages, and to compare the information gathered with the entries in the registers kept at the registering

circles. (29) To fully utilize the provisions of the Compulsory Registration Act IV (B.C.) of 1873; to appoint a person specially to detect all evasions of the requirements of this law and to report the delinquents, and to apply the provisions of section 6 of the Act to the chowkidars and constables whenever they omit to report the events occurring in their beats. (30) To pay earnest attention to the observations and suggestions for the improvement of the sanitary condition of Mozufferpore made by Mr. Hughes, Officiating Superintending Engineer, Sone Circle.

Durbhanga.—*Inspected in February.*—Many improvements were found to have been effected in this town since it was last inspected, and, considering the large extent of ground covered by it, its sanitation seemed to be well cared for. Some progress had been made in the drainage arrangements; and the conservancy establishment considerably strengthened; two burial grounds provided for the Mahomedans, and a Sub-committee appointed to report on the question of closing the numerous private burial places

The suggestions were—(1) To allot an equitable share of the income for improving the sanitation of the town, particularly as nearly Rs. 8,000 per annum had become available by the Municipality having been relieved of police charges. (2) Not to lose sight of the question of thoroughly draining the town, which has been long under consideration, as a general and effectual system of drainage is evidently very much required. (3) Not to permit excavations to be made in the drains, and to require persons wishing to have earth roads made for entry into their houses to provide drain pipes to the drains for the passage of water. (4) To further strengthen the establishment, so that conservancy may be effectually attended to. (5) To provide more public latrines. (6) In building latrines in future to adopt a better plan than that on which the present new latrines have been constructed. (7) To consider the advisability of bringing into use the corrugated iron latrines, Hornbury's patent, sold by Messrs. Burn and Co. of Calcutta, which, if placed on a cemented basement, are free from many objections to which masonry or kutcha structures are liable. (8) To provide a pucca washing place at the end of each latrine, and to introduce the dry-earth system, a small end-shelter being provided for the storage of dry-earth. (9) To introduce Part IX of the Municipal Act for the better control of the private privies. (10) When urinals are erected to provide them with pucca floors shelving down to a little drain ending in a spout to carry the urine into a bucket, the whole nearly surrounded by a sheet of tarred iron. (11) To remedy the defects in connection with the trenching of the night-soil, the trenches being dug one foot wide and one foot deep, and in regular lines. (12) To consider the feasibility of establishing a properly constructed slaughter-house. (13) To dispose of, at any price, the great accumulation of bones at the present slaughtering places. (14) To get the pumps at the public wells repaired, as the lifting of water by a pump, instead of dipping a variety of vessels into the wells, is an immense improvement. (15) To compel the owners of private burial-grounds, under section 256 of the new Municipal Act, to close them. (16) To lay out the Mahomedan burial-grounds in the manner suggested to the Municipal subordinates, so that much space might be saved and the grounds be used a longer time. (17) To take steps to keep the Christian burial-ground in proper order. (18) To undertake, under section 260 of the new Municipal Act, the burial or burning of the pauper dead of both Hindus and Mahomedans. (19) Not to permit the domes to take away the clothing and pillows of the Hindu dead, but to have them burnt along with the body. (20) To take the necessary steps to have the Compulsory Vaccination Act brought into operation in the town. (21) To adopt measures for correcting the defects in the registration of deaths. (22) To institute systematically inquiries concerning the occurrence of deaths in the villages and to compare the information thus gathered with the entries in the registers kept at the registering circles, and to have the chowkidars punished who are found to have omitted to report any death. (23) To fully utilize in the towns the provisions of the Compulsory Registration Act, to appoint a person specially to report evasions by the people; and to deal with the constables and chowkidars under section 6 of the Act if they omit to report the births and deaths occurring in their beats.

Action taken on the suggestions.—It was reported (1) That the introduction of Part IX of Act III (B.C.), 1884, was at a meeting considered necessary, but as the measure was not discussed at a special meeting, as required by law, Government would not sanction it. The question has consequently been postponed pending the formation of the new Municipal Board. (2) That eight wells with pumps have been ordered to be repaired. (3) That additional conservancy carts are to be provided. (4) That an estimate for constructing a regular slaughter-house has been passed, but that the work will be undertaken from funds provided in the next year's budget. (5) That the attention of the District Superintendent of Police has been drawn to the defects in registration pointed out. (6) That the conservancy establishment has been strengthened by 1 jemadar, 1 head mehter and 4 mehters. (7) That the night-soil trenches are being dug one foot wide by one foot deep, and in regular lines. (8) That the Compulsory Vaccination Act has been introduced.

Chupra.—*Inspected in February.*—The sanitary condition of this town cannot be said to be satisfactory, as very grave defects exist, particularly under the heads of conservancy and drainage. In fact its sanitary status has seriously retrograded since it was last visited. This unsatisfactory state of things clearly indicates that the sanitary welfare of the town is little cared for by the Commissioners. The arrangements regarding the disposal of the dead and the conservation of private privies are defective and, in several respects, very objectionable.

The suggestions were—(1) To allot a larger portion of the income of the Municipality for placing the town on a proper sanitary footing. (2) To adopt measures for raising the revenues of the municipality and to apply the amount thus derived to sanitary improvements, the incidence of income to population in Chupra being lower than that of several other Municipalities of the same status containing an equal or even a smaller population. (3) To bestow careful and earnest attention to administering the sanitary clauses of the Municipal laws with activity and closeness, inasmuch as the sanitary welfare of the town hinges, in a great measure, on the strict enforcement of these laws. (4) To introduce the provisions of Part IX of Municipal Act III (B.C.) of 1884. (5) To provide all the roads in the more crowded parts of the town with saucer-shaped drains. (6) To prohibit the throwing of rubbish into the side drains. (7) To proceed more actively with the work of removing the encroachments over the side drains that are to be met with in many places. (8) To specially submit to Government, through the Commissioner of the Division, after the District Engineer's report on the subject is received, the question of the new line of railway, which runs between the town and chour, seriously threatening to obstruct the drainage of the town. (9) To compel the conservancy establishment to perform their duties properly—a set of rules being framed for their guidance and a scale of fines laid down for breaches or evasions. (10) To require the police, through their departmental superior, to look more energetically after those who commit nuisances and bring them up for punishment. (11) To employ street sweepings exclusively in filling up hollows, excavations, foul pools, &c. (12) To provide two gumlahs for each seat in the public latrines, one for fœces and one for urine. (13) To demolish the latrine at the Judge's cutcherry, which is a mere common khuddi, and to replace it by a properly constructed one. (14) To make the moveable latrines fulfil the purposes for which they are designed, that is being moved from spot to spot as the pits get filled. (15) To provide more public latrines, particularly moveable ones, and gradually put down promiscuous defœcation. (16) To carry out, without further delay, the suggestions made in the last Inspection Report regarding the cleansing of private privies by Municipal mehters. (17) To take special care that all the night-soil from both public and private latrines is buried in the trenching grounds and that the trenching is properly and systematically carried out. (18) To keep the night-soil depôts in proper condition and scrupulously clean, and to take great care to have all the night-soil from them daily removed. (19) To adopt measures to secure an adequate supply of dry earth and to carry out the process completely, if it is really necessary to keep up the dry earth shed at Shazadpore for deodorizing night-soil. (20) To adequately strengthen the establishment for the purpose of carrying out the conservancy arrangements effectually. (21) To invite the attention of the owners of the private markets to the very dirty condition of those places, and to induce them to maintain their markets in a clean and orderly state. (22) To consider as early as possible the advisability of establishing a properly constructed and well organized slaughter-house. (23) To have all offensive trades, if there be any, removed out of town. (24) Not to allow the accumulations of dirty water in the neighbourhood of wells, as it percolates back and fouls them. (25) To have the tanks that supply water for watering the roads built at such a height that water can be run off from the tanks into the carts, so that the labour of filling the carts by employing ghurras may be obviated. (26) To reduce the number of Mahomedan burial-grounds, and to close such of them as have become crowded. (27) To prohibit the use of grounds which are situated within the enclosures of houses, and to have the dead buried at a sufficient depth to admit of the chupper placed over the corpse being at least four feet below the surface of the ground. (28) To have the clothes and pillows of the Hindu dead burnt along with the body. (29) To prohibit the throwing of dead bodies into the river. (30) To bring into operation the Compulsory Vaccination Act. (21) To maintain the serais in a better condition and rectify the defects in connection with their general conservancy, drainage, latrine accommodation, &c. (32) To adopt measures for improving registration, which is at present very defective; and to introduce the hath-chitti or hand-book system in Sarun, as is done in some other districts. (33) To fully utilize in the Chupra town the provisions of the Compulsory Registration Act; to specially appoint a person to carefully and systematically detect all evasions of the requirements of the law; and to deal with the chowkidars and constables under section 6 of the Act, for omitting to report the births and deaths occurring within their beats.

Action taken on the suggestions.—Estimates have been prepared for new saucer drains in some of the principal bazars, for two new slaughter-houses, and for several urinals and a latrine for the Judge's Court.

Bettiah.—*Inspected in February.*—This Municipality appears to have grown up around the palace of the Maharaja of the place. The site is a bad one, owing to the swampy nature of the country to the north and east, to the Chandrawat river drying up in the hot weather, and to the lèvel of the town being low, rendering drainage difficult. The sanitary arrangements are of a primitive character, and the need for reform is urgent, particularly in connection with conservancy and the disposal of the dead.

The recommendations were—(1) To allot an adequate share of the income for radically improving the sanitary status of the town. (2) To utilize all parts, particularly Part IX of the New Municipal Act III (B.C.) of 1884. (3) To metal the many kutcha roads as funds will permit. (5) To remove the encroachments over the street drains. (5) To promptly fill up the excavations in which stagnant water collects, which is suspected to cause fever. (16) To repair the pucca drains on the sides of the principal streets. (7) To convert all the

drains to saucer-shaped ones, following the natural outfall, and being connected with houses s. as to carry off the bath and refuse water from them, and with wells to carry off spill water. (8) To provide proper but cheap public latrines (there being none of these conveniences) in the heart of the town, chiefly for women and children. (9) To bring into use the portable (Major Ramsay's) latrine which had been purchased for the kutcherry, but allowed to remain idle; and, if practicable, to introduce more of such latrines. (10) To have the private premises attended to by Municipal mehters, under Municipal supervision, levying a fee for the service. (11) To establish one or more grounds for trenching night-soil. (12) To dig the trenches in regular lines one foot deep by one foot wide, deep pits being scrupulously avoided, so that all nuisance from the process being avoided, cultivators may be induced to give their fields to be manured, or pay the Municipality for manuring them. (13) To adequately strengthen the conservancy establishment and provide additional carts and other appliances in order to carry out the foregoing suggestions. (14) To provide markets and slaughter-houses, as the present arrangements in this matter are unsatisfactory. (15) To repair the protecting rims of those wells which require such repairs. (16) To provide properly protected public wells supplied with pumps and buckets in localities convenient to the people. (17) To fix places for the burning or burying of the dead and to place them under proper supervision. (18) To ask the Maharaja to provide a latrine for his serai and to cause it to be kept in proper order. (19) To introduce the Compulsory Vaccination Act, which is absolutely necessary for breaking down the great opposition to vaccination exhibited by the people and to afford them protection from small-pox. (20) To bring into operation the Compulsory Registration Act and to utilize its provisions fully, and to carry out certain suggested measures for the improvement of registration generally.

Action taken on the suggestions.—The following resolutions were adopted:—(1) Excavations to be filled up with street sweepings. (2) Pay of mehters to be raised to Rs. 3-8 per mensem, in order to check them from selling street sweepings to private persons who desire to fill up excavations on their own lands. (3) Pucca drains to be repaired whenever necessary occasions offer, and estimates for connecting them with house drains and for providing pucca drains round wells for carrying off spill water be prepared. (4) The drains to be constructed in *future* be saucer-shaped, as the cost of converting the existing drains to this shape is prohibitive. (5) Public latrines on a small scale to be provided experimentally, as it is believed that these conveniences will not be used by the people. (6) The portable latrine not to be set up, as nobody but the Sub-Deputy Magistrate had used it since its introduction. (7) The cleaning of private latrines by municipal mehters, and levying a fee for the service, was considered extremely unadvisable, as it would be a hardship to levy a higher fee for the service when the people can employ private mehters at a lower cost; but that stricter supervision should be exercised over the private mehters, and that they be required to file a list of the houses in which they work. (8) That trenching grounds had already been provided, but that the night-soil be trenched in the manner suggested. (9) That for efficient conservancy four sirdar mehters be employed. (10) That it would be unfair for the Municipality to take over the private markets, as they belong to the Maharaja, the land being his, and the fees being collected by him. (11) That protecting irons be supplied to the wells as opportunity offers. (12) That until the provisions of the Act relating to burial-grounds are extended, it would be impossible to exercise supervision over them. (13) That the consideration of the introduction of the Compulsory Vaccination Act be postponed until the next meeting. (13) That the mohurir be warned that he will be dismissed if he does not supervise registration more carefully.

Motihari.—*Inspected in February.*—The sanitary arrangements of this town were found to be not at all satisfactory. Much has yet to be effected before it can be said to be on a proper sanitary footing. The arrangements under the heads of drainage, conservancy, water-supply, and disposal of the dead are all more or less defective. It is under contemplation to provide the town with an effective system of drainage, the levels for this purpose having been taken by the District Engineer.

The suggestions were—(1) To enhance the income of the Municipality by raising taxation, as the incidence of income to population in this town is lower than that of other towns with an equal or smaller number of inhabitants. (2) To allot annually a fair share of the income for improving the sanitary status of the town. (3) To have the kutcha roads metalled as funds will permit. (4) To have the proposed drains made pucca and saucer-shaped, having connections with wells and houses to carry off spill and bath-water. (5) To take special care with regard to the proper use of street sweepings for filling in holes, so that, when they are employed for this purpose, they may be put *into* an excavation and not piled on its edge. (6) To provide public latrines at convenient sites for the poor, the kutchery and the market being also supplied with these conveniences. (7) To introduce Major Ramsay's portable latrines, as they are well suited to this town which is surrounded by fields on nearly all sides. (8) To prohibit promiscuous defæcation when public latrines are established. (9) To rectify the defects in construction and cleaning existing in the latrine connected with the serai. (10) To have the private privies attended to by the Municipal mehters under Municipal supervision. (11) To introduce Part IX of the new Municipal Act, as it would materially help the placing of the conservancy of the private latrines on a proper footing. (12) To provide sufficient and conveniently situated grounds for trenching the night-soil. (13) To provide an adequate conservancy establishment and a sufficient number of carts in order to carry out the foregoing suggestions. (14) To consider the advisability

of establishing a municipal market and a slaughter-house. (15) To have all the wells properly protected, and to repair the parapet walls of those that require repair, to prevent spill-water finding its way back into the wells. (16) To make arrangements for the supervision of all burials in future, so that waste of space caused by burying bodies irregularly may be checked. (17) To see that the corpses are buried sufficiently deep to admit of the chupper usually placed by the Mahomedans over their dead being at least four feet from the surface of the ground. (18) To take steps to have the Compulsory Vaccination Act brought into operation. (19) To cause the Overseer and Tax Collector to supervise the registration of deaths. (20) To fully utilize the provisions of the Compulsory Registration Act IV (B.C.) of 1873, and not to permit it to remain a dead letter.

Monghyr.—*Inspected in February.*—Although there is considerable room for improvement, the sanitary condition of this town is satisfactory There was clear evidence, at the time of my visit, to show that its sanitary interests were carefully attended to by the Commissioners. The roads were in good condition; the conservancy arrangements continued to be looked after with commendable care and attention; the kutcha wells were being converted into good substantial pucca ones, one being taken in hand annually. The drainage system is however to a certain extent defective, but the Commissioners, with the limited means at their disposal, are trying their best to remedy the defects. The arrangements regarding the disposal of the dead are unobjectionable, with the exception that those who cannot afford the cost of cremation throw their dead partially burnt into the river.

The suggestions were—(1) To devote a larger share of the income for sanitary works, as the present allotment of only 8·6 per cent. of the income did not appear a fair one, specially as over Rs. 9,000 per annum has been set free by the Municipality having been relieved of police charges. (2) To metal the kutcha roads gradually. (3) Pending the solution of the question of a more perfect system of drainage, to substitute pucca shallow saucer drains for the deep ones whenever any portions of the latter fall into disrepair or new drains are necessitated. (4) To consider the question of utilizing the Latrine Act, which has already been sanctioned, and to extend to the whole town the scheme of cleaning the private privies by Municipal agency. (5) To give a trial to Major Ramsay's patent portable latrines, as they seem peculiarly suitable for the use of the people living on the outskirts of the town. (6) Gradually, as funds will permit, to provide the pucca public latrines with additional ventilation. (7) To direct the police to prohibit people from urinating at places other than the public urinals, and to bring up the offenders for punishment, on pain of being reported to the Magistrate in case of laxity in the performance of this duty. (8) To prohibit the practice of throwing partially burnt dead bodies into the river and of burying dead animals on the river banks. (9) To request the Superintendent of Vaccination, Sonthal Pergunnahs Circle, to supply thoroughly trained vaccinators for the town. (10) To adopt such measures as will radically improve the registration of deaths in the district. (11) With regard to the town, to fully utilize the provisions of the Compulsory Registration Act; to appoint a person to seek out and report regularly those who omit to register births and deaths; and punish the constables and chowkidars under section 6 of the Act in every case in which they omit to report births and deaths.

Action taken on the suggestions.—The question of a more perfect system of drainage was considered by the Commissioners, but considered not feasible on the ground of cost. But this matter, it is reported, will not be lost sight of, and that in the meantime saucer drains are to take the place of the present deep covered ones when the latter are to be repaired, or new ones are required. The Commissioners are not at present in favour of Major Ramsay's portable latrines. Pucca latrines will be gradually provided. Steps have beentaken to bring the law relating to latrines into operation, and to stop the practice of urinating on the public thoroughfares, the police having been instructed to bring up offenders for punishment. Orders have been issued to stop the practices of throwing half-cremated dead bodies into the river, and of burying dead animals on its banks. The Civil Surgeon has been communicated with regard to the unsatisfactory working of the Vaccination System in the west of the town, and the special attention of the District Superintendent of Police and of the Municipal authorities has been drawn to the subject of registration, resulting in a marked improvement.

Jamalpore.—*Inspected in February.*—The sanitary condition of this important towns was not found to be good, and many grave defects called for rectification.

The recommendations were—(1) To allot an equitable share of the income for carrying out sanitary reforms. (2) To administer the sanitary clauses of the Municipal laws with greater activity and closeness than was being done. (3) To substitute saucer-shaped drains for the deep ones, which are very faulty in construction and obstructed in various ways. (4) Pending the construction of the saucer drains, to prevent accumulations of foul water in the existing drains and to keep them in effective working order. (5) To remove the existing encroachments over the drains and strictly prohibit all future encroachments. (6) To remove the night-soil to the trenching ground at least twice in 24 hours, discontinuing the present objectionable practice of permitting it to accumulate in the iron receptacles for a whole day to be removed at night. (7) To prohibit the municipal mehters from performing work on their own account. (8) To afford the public latrines better ventilation than obtaining in them at present. (9) To tar the latrine drains. (10) To provide the market and kutcheries with latrines. (11) To provide a basin to catch urine and washings in the new latrine in the European quarter of the town, so as to prevent the liquid passing into the drain. (12) To work the portable latrines properly, moving them frequently over

shallow trenches, as at present large cess pits, full of soil which will take a long time to be absorbed, are seen throughout the station, which are themselves unsightly without the danger of their affecting the water-supply. (13) To dig the trenches 1½ feet wide by 1 foot deep in straight lines across the ground, avoiding the present deep pits, which prevent the night-soil being absorbed by the roots of the plants. (14) To induce the owners of the private market to have its floor and drains paved, and to provide it with water and latrine services. (15) Pending the carrying out of the proposal to improve the drinking water-supply of the station by the Railway Company and Government, to put into order the public wells and to provide them with platforms and drains, in order that the re-entry into the wells and soakage into the ground of spill-water may be obviated. (16) To give early effect to the proposal to close the burial-grounds for Mahomedans, which have become overcrowded, and to provide another ground in their place. (17) To discourage the practice of the chamars and domes eating the flesh of dead horses and cows. (18) To take steps for the improvement of the sanitary condition of the villages of Nyagong and Jahangera, which are reported to be unhealthy, or, as contemplated, to remove a part of the former, so as to leave a considerable space between it and the European quarter of the town. (19) To fully utilize the provisions of the Compulsory Registration Act, and to improve registration generally.

Action taken on the suggestions.—It was resolved (1) To allot a larger portion of the income for sanitary improvements, and for increasing the supply of well-water as far as the means at disposal will admit. (2) To adhere to the bye-laws rigidly. (3) To have kunkur supplied for the repairs of the roads examined by some competent person, such as the Road Cess Engineer. (4) To adopt steps for the survey of the existing system of drainage with the view to improvement, and that in the meanwhile the suggestion to keep the drains in effective working order be carried out as far as practicable. (5) To adopt steps for the more speedy repair of the carts and to provide additional carts. (6) To put a stop to the mehters performing private work on their own account. (7) To build two more public latrines. (8) To provide additional buckets in order that night-soil might be removed twice in 24 hours. (9) To have the ventilation of the public latrines examined by an Engineer. (10) To tar the latrine drains. (11) To provide basins to catch the urine and washings in the new latrine. (12) To give immediate attention to the suggestions regarding the portable latrines and the trenching of night-soil. (13) To call upon the owners of the market to rectify the defects pointed out. (14) To ask the Agent of the East Indian Railway Company to make a grant-in-aid for digging additional wells within the limits of the Company's ground. (15) To reopen the question of providing a new burial-ground for Mahomedans, with a view to close the existing one. (16) To call the attention of the Agent of the East Indian Railway to the correspondence on the subject of the removal of Nyagong. (17) To adopt steps for rectifying the sanitary defects of Jehangira.

Suburban Municipality.—*Inspected on 6th, 13th, 14th, 17th and 18th March 1884.*—*6th March.*—1. Began the inspection of this Municipality, visiting latrines in Kidderpore and Watgunge and the Kidderpore bazar, which was rather an uninviting place, with the outfall of the pucka drain into Tolly's Nullah requiring attention. Sweepings from the drains of the bazar should be collected for removal, and not allowed to pass into the nullah to be carried away by the tide.

2. With regard to the latrines seen to-day (except the ones connected with the Government Dockyard) they seem to be made unnecessarily high, with too great an amount of brickwork. There is such a distance for night-soil to fall into the pans that splashing occurs, with fouling of the arched spaces underneath as a consequence. Expense would be avoided with the use of less brickwork.

3. Messrs. Gillanders, Arbuthnot & Co. are building a new latrine for the Hooghly Jute Mills in Garden Reach. It is enclosed on two sides by a wall, about 12 feet high. A high wall behind also shuts its end, so that it can only be ventilated at one end. The roof is close down on the latrine building, so as not to show over the hiding wall. The result of these defective arrangements is that the latrine towards its middle cells is pitch dark, without the slightest ventilation, and will be a disagreeable and noisome place, which will be avoided in every possible way by the coolies for whom it has been constructed, and from its closeness may become offensive to passers-by on the road. Too much has been sacrified to external appearances. The outer wall should have large holes made in it for the passage of air, the roof of the latrine should be raised, part of the entrance walls to the cells should be curtailed or perforated, and the whole place so constructed that there will be a free passage of air through it at all times and seasons.

4. The water for this mill is taken from the Moti Jheel on the other side of the road, and the water after passing through the engine boilers passes into a small open tank, where it cools and from which it recrosses the road into the jheel. The coolies bathe in the warm-water tank and drink from the Moti Jheel, which was formerly clear water covered with weeds, and is now rather dirty looking, evidently from earth. It is said that water is at times brought from the river, and after being used by the boilers passes into the tank. I could not get any correct information as to the consequence to health of the use of this water. The Moti Jheel is used for bathing, and there are native huts at the further end, the filthy water of which no doubt drains into it. It was formerly considered the best water-supply in Garden Reach.

5. I visited the Paharpore trenching ground, and found the ground much too small for the purpose. Here pitting of night-soil was done on a large scale; 20 cart-loads a day was

suggested, but I should think a great many more. There were large pits brimfull with quite an insufficient supply of earth to cover them. The soil ferments and reappears on the surface, and the stench and plague of flies was dreadful. A dweller near said it was often so bad that they could not eat their food. There was an old tank or hollow partly filled with liquid refuse as if latrine washings had been brought and thrown in mixed with sewage. This ground should be abandoned for a time, and a more extensive one taken up. If any one can be got to cultivate it, so much the better. If not, if the contractor would raise fodder crops for his cattle, it would be a good use to put the ground to and improve its salubrity. If every cold season a large extent of rice land was taken up for *one year only*, and manured in shallow trenches, I think the time would come when people would allow their lands to be used for this purpose willingly. They will never give them up for deep trenching, which puts the fields out of cultivation for so long and makes them so foul. I believe it is the offensive deep trenching system that influences the people so unfavourably towards the system of manuring. Using rice fields in the cold and hot seasons, the raised grounds would be available in the rains. The Paharpore trenching ground is about two miles from Kidderpore bridge.

6. The sanitary condition of the part of Garden Reach near the ex-King of Oude's is a scandal. It is impossible to find words to describe it. It seems within its limits to concentrate all the conditions which are contrary to health, and requires, if beyond the powers of the Municipality, the immediate attention of Government.

7. The Bengali bazar is one of the worst bustees I have ever seen. It is crowded with houses so close together that the sweepers must have great difficulty in penetrating with buckets to the private latrines, which abut on lanes left between the huts. The lanes are filled with rubbish and full of offensive sludge. This bustee is without drainage, without proper roads, much overcrowded, and in an unspeakably filthy condition, refuse apparently never being removed from it.

8. The drains throughout the Garden Reach quarter appear in a bad state, too deep, and often choked with collections at places of foul water. There is a creek in Garden Reach which passes through the ex-King of Oude's enclosure, which commands its outfall where there ought to be a sluice, as in high tides the water dams back far into the suburbs, and then night-soil is thrown into it, which passes into the river to the injury of the health of the Port. There ought to be a sluice gate at the outlet of this creek under the control of the municipality.

9. *13th March* 1884.—Continued the inspection of the Suburban Municipality, and devoted attention to the Bhowanipore and Kalighat neighbourhoods. I found that the Kamrangatulla drain, which receives the drainage of the Russa roads and bustees to the east of the road, where it becomes kutcha, is in a very bad state indeed. The fluid filth which it conveys is sewage apparently, and is quite at a standstill, no motion being apparent in it. There was a deep, black, fœtid mass which would not move on till flushed out by a storm. The drain was kutcha and wound among bustees with privies opening upon it, which were quite unapproachable without wading up to the knees in the filthy fluid.

10. The Gungaram busti was in a very bad state, full of herds of buffaloes which are now wallowing in mire, so that the condition of things in the rains must be infinitely worse. There is no drainage. The condition of Gungaram has been considered, and it is the intention of the Municipality to remodel it.

11. In the bustee called Mallye, to the east of this and bordering on the Circular Road, there was no latrine accommodation for the people, and squatting was common. This was evidently brought about by the proprietor having according to law erected a latrine on the property; but as he insisted on being paid for its use, the people were driven to the disgusting practice in a crowded place of easing themselves in the open spaces.

12. There is a tank in Kassia Bagan close to the Circular Road, behind Mr. Webb's house, which stands on the road, which is in a dangerous state. It has been partly filled up, and this process has been stopped, as Mr. Webb objected. One-half is now quite filled up and dry and the other filled apparently to a slight depth with thick fluid. It would be much better to continue the filling up, beginning from the shallow south-west corner and dewater the deeper part if any great amount is found present. The vegetation growing on the surface gives the appearance of its being however shallow throughout.

13. Kalighat temple and neighbourhood is in a bad state, but not so objectionable as when last visited; but the bustee requires to be laid out anew with proper roads and side-drains. The burning ghat at Kalighat is well kept.

14. The Dakuria trenching ground is much larger than the one visited before, and is in better order. It has not been cultivated, which is a mistake. I was told today by the man who formerly had such difficulty in disposing of vegetables grown here that the prejudice is disappearing.

The burial ground of the Mysore family is in good order.

15. Generally the parts visited today, as the day before, were deficient in latrine accommodation; one erected in a bustee had been built around so closely that it had gone out of use. Latrines generally not well kept.

16. *14th March* 1884.—Inspected today parts of the town east of Circular Road, Kurryah, Tengra, and Entally. All these places seem badly supplied with latrines. The Tiljullah burial-ground used by the town and suburbs is a Mahomedan and low class Hindu place of interment. The Hindu part seems much overcrowded, and when in digging new graves bones are turned up, they are thrown into a shallow tank, the falling

water showing many skulls and bones on the bank, so that the bottom is most likely covered. This ground should be extended, and parts now over-used closed for a number of years.

17. Inspected Mr. Masson's yard for the preparation of skins, and found that, with better arrangements for the disposal of refuse water, it might be carried on without nuisance. Part of a godown in which skins were being steeped required re-flooring, to provide for the proper removal of spill water.

18. Inspected the premises of the Gobra Tanning Company, and found them well conducted, except the provision for the removal of the refuse water, which is collected in a tank and removed by carts once a week. The Manager proposes to lay a pipe drain from the premises to the main outlet drain, 1,400 feet distant, which he may be able to do. The necessity of a flushing apparatus to keep the pipe clear has been explained to him. The main drain seen (No. 8?) did not contain any water. Its bottom and sides were only *a little damp*. The whole area affected by this drain allows all bath and refuse-water to soak in.

19. Inspected two hog's lard factories, one in possession of a Bengali, and the other of a Chinaman. Great herds of pigs are no longer kept here, but only a few brought in from Dhappa and daily slaughtered. After a smart outbreak of cholera in the bustee, the removal of the pigs was carried out.

20. Inspected the Tengra slaughter-house, and found it in good order. Saw part of the new canal for the removal of Calcutta storm water; the stream was *inwards towards* the town, and consisted of very dark coloured fluid. There is abundant earth from the various canals here to fill up many tanks.

21. *The 17th March* 1884.—Continued inspection of Suburban Municipality and visited Shah Bagan bustee, which is beside the new ice works. There had been a bad outbreak of cholera lately, the officer in charge of the ice works thinking that it depended upon the filling up of a small tank with street rubbish, which was imperfectly covered over with earth. There are, however, two or three bad water-tanks in the bustee; two are now used to receive water from the ice-house engines, and are according to the above official rapidly improving in quality, the water being constantly changed, fresh supplies being brought in from the canal, treated and passed into the tanks. There is, however, no drainage in the bustee of any kind; all refuse water sinks in and at some places is very foul, as just behind the residence of the Engineer in charge of the ice works. The boundary drain of this bustee is nothing but a common place of easement There is a small latrine, but it must only be used by a part of the people. A private latrine examined had not been cleaned lately.

22. When the tank was filled up, the ground was not properly levelled, so that surface water might pass into the drain. What ought to be drains close past house doors are all blocked with rubbish.

23. Visited Kassai bustee, which has been improved; but the land is not being taken up rapidly, as the Government charges high rents. There was a latrine, but it can be only partially used, as there is general defæcation.

24. There are mat-latrines all along the canal. They seem to be kept in good order and often tarred all over the walls, seats, floors, &c. The roof is corrugated iron.

25. Visited Bahir Mirzapore goala basti formerly in such a bad state. It has much improved, as the cowdung is collected in tanks and what is not made into cakes is removed at the expense of the goala by the contractor. The situation of the bustee is low, three or four feet below the level of the surrounding land. The drains are no longer filled with cowdung.

26. Simla bustee is another goala village. The cow houses kept in better order than formerly, but on the east side of the bustee the stench is dreadful from general squatting. It is said that the workmen of Dino Baral and of Seram Palit's oil-mills reso rt to this place, as there is no latrine accommodation for the mills. The canal latrine No. 4 near at hand was evidently little used, the ground about being covered with fœces. There are several Mahomedans' burial-grounds in this neighbourhood, mostly overcrowded and surrounded by houses. The Moonshepara one is surrounded by houses, overcrowded, and should be closed. There were three tanneries here, the smell of which was complained about. There was not much to find fault with, except that there was no outlet for refuse water, which collected n holes and evaporated, leaving dirty masses of refuse.

27. Haldar Bagan, another goala bustee, is in its original condition. It miust contain about 150 cows, and there is absolutely no arrangement for the removal of the cowdung. It flows out of the cow-houses into drains in several directions, generally leading to the public roadside drains to the south. One ditch was blocked. It must have been about 200 yards long, two feet deep, and four feet broad, one mass of cowdung from end to end. They were other shorter ditches in the same state, The long one had been blocked at one end to prevent the dung passing into the public drain, which it had done before and dried up. The dry manure was being liquified again by water from a tank being emptied. One cow stable emptied out into a circular tank, which was filled with cowdung and never emptied. This was bubbling and fermenting. The house latrines were in a bad state, and evidently never cleaned. There was several most unwholesome looking water tanks about the bustee. Altogether it was in the worst possible sanitary condition, and it was evident that no proper means had been taken to make the people mend their ways. Heavy daily fines are required until a better state of matters is brought about.

28. *18th March* 1884.—To-day inspected the northern part of the Suburban Municipality up to its limit at the Chitpore Burning Ghat, which was well kept. Three deaths from cholera were registered on the 14th. Some people living near said sparks flew from

the cremations and endangered their leaf and grass huts, and desired a protecting exterior wall to keep off the wind, which they represented carried the sparks.

I observed the Public Works Department have planted trees along the Circular Canal, but that many of the baskets, for which I am informed, they paid Re. 1 each, which should protect the trees, are so ruinous and in cases so low that they no longer answer the purpose, and the trees can easily be destroyed by cattle.

29. I examined the Talla north night-soil burial-ground. There were loud complaints against it and information given that a number of coolies had been put on just before my inspection to cover over evil smelling trenches. They had not succeeded in destroying the stench, which was strong in places. It is now, however, going to be cultivated, which will remove the bad smell and bring the soil into a wholesome condition. Plantains are going to be put in. It is evident that the ground has been badly attended to.

30. I examined the premises of a company who makes bone dust and phosphates, and found little to complain of considering the nature of the business. There was of course smell from the collection and preparation of bones, but the factory is well removed from other houses, being bounded by the canal on one side and by gardens on the others. There was refuse horns which were disagreeable, and should, if useless, be otherwise disposed of in place of merely being thrown out They should be removed either to the Salt Lake with the Calcutta rubbish or other convenient place. The company should not allow the workmen to squat about the place. There should be a simple latrine for their use and a sweeper to clean it. A moveable latrine over a shallow trench might answer the purpose.

31. I inspected the Ghose Bagan, one of the improved bustees, which was open, clean, and well laid out; but Nawabputti, Gasiarapara, and Chooriharapara were densely overcrowded, especially the first, and were merely close aggregations of huts crowded together without any arrangement for drainage or ventilation. They are often much overcrowded with people, being full of lodgings for mill hands, who are often said to sleep one above another as if in bunks in a ship. Cholera has lately been in Nawabputti I visited the North Suburban Vaccine Depôt. There as well as at Bhowanipore the books had been removed by the Inspecting Officer, Preamber Babu.

32. *Points requiring attention.*—(1) Proper attention to surface drainage by the provision of pucka drains where possible and keeping kutcha ones clear Something more is required. however, in the crowded parts of the town. All the divisions from the Barrackpore road bridge between the Circular Canal and the Circular Road south to Sealdah should have underground drains and drain into the Calcutta sewers. From Sealdah station southwards the divisions lying along the Circular Road, such as Entally, Kurrya, Tiljullah, North Chukerbeya, Kasi Bagan, and Bhowanipore, should have underground drains communicating with the Circular Road drain, and all public privies in these divisions should be connected with the town drains. Night-soil from private and other privies not directly connected with the drains should be discharged into the drains at suitable places. This would relieve the conservancy establishment of enormous labour, and after the first expense would relieve the Municipality from considerable annual charges. Under the system of conservancy as at present carried out, one-third of the night-soil of these, the most crowded parts of the town, is never removed. What is removed is pitted in night-soil trenching grounds, which afford inadequate space for the proper carrying out of this plan of disposal, and they become a nuisance and danger to the neighbourhoods in which they are situated.

33. I would bring specially under the notice of the Commissioners that the cleaning of private privies is most imperfectly carried out, and many have the appearance of never being cleaned. The contractor must be kept up to his work, or the duty undertaken by the Municipality itself. The present state of matters is not only a wrong to the people, but a constant danger to the public health.

34. In providing public latrines I should recommend to the Commissioners that in future the parts for males and females should be distinctly separate buildings, and that proprietors of lands who are obliged to erect public privies be not allowed to levy prohibitive charges on the people for the use of such privies. The disgusting practice of squatting on unoccupied lands still continues, not only common, but the rule wherever there is such a piece of land. In one of the improved bustees, Kasia Bagan, the open spaces were covered with human ordure, and the place generally stank. What is the use of the Municipality making good improvements, such as has been done in this village, and then allowing the ground to be poisoned before it has again been taken up for houses? Is there no system of police by which the Municipality can remove this evil; or, in the event of want of legal power, cannot it be procured from Government for the sake of the public good?

35. I can say, during my inspection, extending over five days, I met no police constable or officer in any part of any division of the Municipality, except at stations, though their presence was urgently required; nor did I see any one apprehended for the commission of nuisances, though I saw them frequently committed. I am informed that persons brought up for offences of this kind are very inadequately punished, and the result is that either from defect of law, negligence of police, or inadequate punishment, the Suburban Municipality is in a state which is a disgrace to the Commissioners.

36. I note that in 1882 there were 2,470 deaths from cholera in the suburbs, which is the highest record in ten years, except 1876, which gave 3,119 deaths. The year 1883 gave 2,177 deaths, so that the death-rate from this disease is by no means sensibly declining, although

many residents in the suburbs avail themselves of Calcutta filtered water. If there were any material improvement in the sanitary condition of the suburbs, a fall in the cholera death-rate would follow.

37. In spite of the improvement of some bustees, the removal of the herds of swine, the cleansing of some of the goala bustees, the state of the Suburbs is still such as to constitute a grave source of danger to the health of the town of Calcutta, the Port with its shipping, and to the country generally from its relation to commerce. The Commissioners should consider the necessity of the appointment of an Officer of health, whose services are urgently required; and if this officer were granted magisterial powers, so that questions affecting health were adequately dealt with, some change in the present state of matters might be brought about. Its continuance will, I am sure, be no longer tolerated if brought to the notice of the Government. Important industries are yearly springing up in the Suburbs, so that sanitary reform becomes in an equal ratio important and urgent. I note that in the report on the sanitary measures in India in 1881-82, presented to Parliament, the insanitary condition of the Suburbs is dwelt on, and its present state compared to that of Calcutta before the days of sanitary reform.

Action taken on the suggestions.—Paragraph 1.—The Collector of the 24-Pergunnahs has been requested to carry out the suggestion of the Sanitary Commissioner regarding the removal of sweepings of the Kidderpore bazar.

Paragraph 2.—Orders have been issued to the officers concerned pointing out the remark of the Sanitary Commissioner on the construction of latrines, and to report if anything can be done to put the latrines referred to in good order.

Paragraph 3.—Messrs. Gillanders, Arbuthnot and Company have been requested to afford better ventilation to their latrine accommodation by means of opening in the front covering wall of the latrine and in the back wall, as suggested by the Sanitary Commissioner in his letter No. 208 of 20th January 1885.

Paragraph 4.—The matter is still under consideration of the Commissioners.

Paragraph 5.—The House Service Contractor has been directed to remove the Pahar pore trenching ground to a suitable place.

Paragraph 6.—The matter has not been finally considered by the Commissioners.

Paragraph 7.—Steps are being taken to improve the Bengali bazar.

Paragraph 8.—The matter has not yet been finally disposed of.

Paragraph 9.—Steps are being taken to improve this drain.

Paragraph 10.—Steps are being taken to improve this bustee.

Paragraph 11.—The matter is still under consideration of the Commissioners.

Paragraph 12.—The sweeping contractor has very nearly completed the work of filling up the tank referred to.

Paragraph 13.—The question of the Kallighât bustee is under the consideration of the Commissioners.

Paragraph 14.—The House Service Contractor of the Municipality has been directed to carry out the Sanitary Commissioner's suggestions, but I am afraid the Commissioners cannot compel him to do so.

The Deputy Sanitary Commissioner, Metropolitan Circle, has furnished this office with his suggestions in connection with the construction and management of public privies, and the subject is still under the consideration of the Commissioners.

Paragraph 15.—Overseers and Inspectors attached to this Municipality have been directed to submit detailed reports showing the existing state of things as well as proposals for improvements.

Paragraph 16.—The Engineer of this Municipality has been directed to select suitable land immediately adjoining the Tiljullah burial-ground.

Paragraph 17.—Mr. Mason has closed his place of business.

Paragraph 18.—The Gobra Tannery Company has carried out the suggestions of the Sanitary Commissioner.

Paragraph 19.—The Sanitary Commissioner's report shews that no pigs are now kept by these people.

Paragraph 20.—The canal authorities have been written to on the subject

Paragraphs 21 *and* 22.—The nuisance complained of, as caused by the filling up of the tank, has been removed. There are two latrines in that bustee,—one built by the Commissioners at the cost of the owner, and the other belonging to a mehter. The owner has been directed to build a third to the west of the bustee. The matter of the tanks is still under the consideration of the Commissioners.

Paragraph 23.—The latrine at Cassie bustee is being used by the ryots.

Paragraphs 24 *and* 25.—No remark is necessary.

Paragraph 26.—A report regarding this bustee has been submitted by the Overseer, and the subject is under the consideration of the Commissioners.

Paragraph 27.—A Committee was appointed for the consideration of gowalla bustees, and the subject had been to a certain extent considered by that Committee, when it was dissolved on the formation of the new Municipality.

Paragraph 28.—The Superintendent of the Municipality inspected the burning ghât and suggested that a new wall should be built to the west of the burning ghât in order to make it more private, as the cremation of bodies is seen from the river. If this wall is built, the Commissioners will probably not be required to raise the wall proposed by the Sanitary Commissioner, as this new wall will shut out the wind.

Paragraph 29.—The Talla night-soil burial-ground complained of therein has been closed.

Paragraph 30 —The Sanitary Commissioner has nothing to complain of about this place of business. The refuse referred to therein has been cleared away, and the work is now being carried on properly.

Paragraph 31 —The bustees referred to therein have been inspected and reported on by two medical officers. The matter is under the consideration of the Commissioners.

Paragraph 32.—Copy of the reply from the Calcutta Corporation is herewith sent for the Sanitary Commissioner's information.

Paragraph 33.—Efforts have been taken to carry out the works of cleansing the privies satisfactorily. These have been partially successful.

Paragraph 34.—Instructions have been given to the Engineer of the Municipality that in future the Sanitary Commissioner's suggestions as to separation of latrines to be used by males from those by females are to be attended to whenever possible, and the question of levy of prohibitive charges by landholders for the use of latrines is under the consideration of the Law Committee. A letter has been written to the owner of the Malic bustee, pointing out that, unless the latrine is opened to the public, the Commissioner will be obliged to prosecute him for allowing the nuisance of squatting on unoccupied lands.

Paragraph 35 —The attention of the Deputy Commissioner of Police has been drawn under section 365 of the Act.

Paragraph 37.—The Commissioners regret that there is no prospect of the Municipality being able to afford to appoint a Health Officer.

From - ROBERT TURNBULL, ESQ., Secy. to the Corporation of the Town of Calcutta, to the Superintendent, Suburban Municipality. No. 1786, dated Calcutta, the 3rd November 1884.

IN reply to your letter No. 195, dated 8th ultimo, I am directed to forward a copy of a note by the Engineer to the Corporation on the points adverted to.

Note by the Engineer of the Corporation of the Town of Calcutta, relating to the drainage of the Suburban Municipality.

1. The enclosure to Mr. Owen's letter is an extract from paragraph 2 of the Sanitary Commissioner's report on the Suburbs, dated 24th March 1884, and the remarks made may be conveniently divided under two heads,—

1st—The drainage of the suburban area between the Circular Canal and Upper Circular Road from the Barrackpore Road to Sealdah; and

2nd—The drainage of the suburban area skirting Lower Circular Road from Sealdah to Bhowanipore.

2. As to the first of these, I have to remark that our Commissioners have had an engineering survey in hand, which is now on the eve of completion, for preparing a complete scheme of drainage in connection with the Upper Circular Road sewer, and it is probable that the scheme will be ready in the course of two months or so.

3. As to the second, I have to remark that it is not practicable to make use of the Lower Circular Road sewer for drainage of the Suburbs, with the trifling exception to be presently mentioned. The general fall of the land is to the south-east, and to attempt to use the sewer for its drainage would be equivalent to attempting to compel water to run uphill. The only proper plan for draining the locality in question is to make it form a portion of a comprehensive scheme of arterial drainage to the Biddiadhurry River, towards which ultimate outfall the general drainage plan of Calcutta itself is gradually tending. The exception to which I have alluded to is the premises on the suburban side immediately abutting on the Lower Circular Road, the compounds of some of which may find relief in the sewer beneath that road, and on this point the Town Council, at their meeting on 30th August last, resolved to address the Government.

4. I take this opportunity of again noting the physical conditions to which I have many times alluded in more or less direct terms, viz., that the drainage of Calcutta can never be considered complete until its outfall be carried through the Salt Water Lakes to the Biddiadhurry River, and that the drainage of the suburbs is inseparably connected with that of Calcutta. I may further add my opinion, though it has no novelty, that the reclamation or regulation of the Salt Water Lakes is also intimately connected with, if not a necessary adjunct of, the subject.

Darjiling.—*Inspected in May.*—Some improvements were effected in this Municipality since it was last inspected in November 1883, chiefly under the heads of conservancy, water-supply, and drainage; but there were still exist several sanitary defects requiring rectification. It will be seen further on that almost all the suggestions made at this inspection have been given effect to.

The suggestions were—(1) To allot annually a much larger proportion of the income for improving the sanitary status of this sanitarium. (2) To provide new fencing in the place of the old wooden one which has become rotten and useless, throughout many parts of the town, particularly that through Wilson's bustee, where it is in a dangerous condition. (3) To attend to the preservation of the few remaining forest trees in the station, and to the necessity of planting others to replace them as they die out and are destroyed. (4) To have the sites of the excavations dug out for new houses on the part of the Beachwood property sloped off before the houses are occupied, to prevent accidents. (5) To consider the advisability of purchasing or securing under the Land Acquisition Act all available land for house building, and constructing thereon native houses upon a good and healthy plan, as this course would be greatly advantageous to the sanitary condition of the Municipality. (6) To attend to the cleaning of the drains and to the removal by the sweepers of many things that are thrown into them. (7) To cause rubbish and other offensive matter to be removed from the upper part of the jhora which continues down past Mr. Jeffrey's house, and to put a stop to the practice of throwing such things there by sweepers and householders. (8) To have better connections with public drains for almost all the houses in the bazar and throughout the station, and to use, when possible, good cement in making these connections, so that the use of wooden shoots for the purpose may be avoided. (9) To invite the attention of the Priest to the dirty condition of the drain from the cookroom of St. Joseph's Seminary past the servants' houses of Meadow Bank, and to get the above-mentioned drain made pucca till it passes below the servants' houses. (10) To have the servants' latrine right under the dining-room windows of the Drum Druid, and the Campbell Cottage latrine which stands only 22 feet from the drinking water reservoir, removed further off. (11) To extend to the whole of the Municipality Part IX of the new Municipal Act III (B.C.) of 1884. (12) To see that the night-soil is always actually buried. (13) To call upon the owners of the private markets to provide latrines at these places. (14) Not to allow the horns and bones of the cattle slaughtered to lie about the slaughter-houses. (15) To have the dead bodies well covered with earth, the graves being dug sufficiently deep for the purpose, which does not appear to be done at present. (16) To strictly apply the provisions of the Compulsory Registration Act, so that the drawbacks mentioned, namely, that the Europeans delay registration and the natives are prejudiced against the measure, may be overcome; to appoint persons to detect evasions on the part of the people; and to get the constables and others who have to report the births and deaths, punished under section 6 of the Act when they omit to perform this duty.

Action taken on the suggestions—(1) Government has been asked to extend Part IX of Act III (B.C.) of 1884 to the entire Municipality. (2) The old wooden fencing has been extensively repaired, including that through Wilson's bustee, but gaps in fences cannot be a oided, as many railings have been stolen. Provision will, however, be made in next budget for new fencing. (3) The question of tending and planting trees is receiving attention. Several sickly-looking conifers on the Mall road, which interfered with the growth of the Cryptomeria Japonica having already been felled. (4) The builders of houses on the Beachwood property have been warned against the dangerous practice of not sloping off the excavations made by them out of the hill along the cart-road, and it is intended at the next meeting to consider the question of moving Government to sanction bye-laws under section 232 of the Bengal Municipal Act, 1884, empowering the Commissioners to control every description of excavations. (5) All drains have been cleared of jungle and rubbish, and arrangements have been made to employ a fixed establishment on this work. (6) The jhora, which continues down past Mr. Jeffrey's house, will be converted into a stone drain, and proper connections from neighbouring houses joined to it. (7) Many of the house drains have already been connected with the road drains, and this work is progressing. (8) The bathing platform on the left of the road a little below the *Darjiling News Press* has been entirely removed. (9) The subject of cementing the drains has been considered, and an experimental drain before Hingun Durjee's house is being constructed. (10) The objectionable drain from the cookroom of St. Joseph's Seminary has been replaced by a good stone drain. (11) The urinal at Campbell Cottage has been demolished, and the drain passing below the servants' houses has been closed up, a roof gutter being substituted. (12) The worst part of the channel from Beachwood, that is the length between the cart-road and Oojagir barber's shop, has been taken up and is being remade with stones bedded in mortar. Other parts of it will receive early attention. (13) The drain behind the kutcherry has often been cleared, but to remedy the evil radically, it is necessary to open it up along its entire length. (14) As soon as funds are available, the shoot of the wire tramway will be put in hand, and then the owners of Isabel Cottage will have no grounds of complaint. (15) Two more public latrines and urinals combined have been built, and others will be commenced as soon as possible. (16) The Drum Druid latrine has been demolished. (17) The Campbell Cottage urinal no longer exists. (18) Several new private latrines have been built, and requisitions have been issued for the construction of others. (19) Steps have been taken to put a stop to the practice of throwing night-soil down the khud by prosecuting and fining the offending mehters; but it is proposed to use swing buckets carried by two men on a pole for this purpose. (20) The ironwork

of the covered market has been fixed, and the building is in rapid progress. (22) Notices have been served on the owners of private markets for the construction of latrines, which are now being built. (23) The cleanliness of the neighbourhood of the slaughter-house has received special attention, and the bones and horns of cattle slaughtered are sent to the cinerator. (24) More hydrants have been added, and it is proposed to still further increase their number. (25) It is believed that it will be most difficult, if not impossible, to change the alignment of the water-pipe through the Drum Druid and Post Office compound, but as the Drum Druid latrine no longer exists, one at least of the objections raised has disappeared. (26) The Executive Engineer will no doubt be moved to alter the alignment of the sanitarium water-pipe. (27) The suggestions about washing-places will be attended to when additional washing-places are to be provided, caste prejudices being considered. (28) Six feet having been fixed by the bye-law on the subject as the depth of a grave, that depth has been enforced. (29) The registration of births and deaths cannot be regulated by the Commissioners, as their record is kept by the police.

Kurseong.—*Inspected in August.*—The sanitary arrangements of this Municipality were in many respects satisfactory. Much improvement had been effected under each head of sanitation since the town was last inspected. There existed, however, yet several defects which called for rectification.

The suggestions were—(1) To utilize all the parts of the new Municipal Act III (B.C.) of 1884, particularly Part IX, and to frame and bring into operation a code of bye-laws to give force and better efficacy to the Municipal law. (2) To prohibit the shopkeepers from forming encroachments on the street side drains. (3) To increase the conservancy establishment, so that surface cleansing and the latrines may be better attended to. (4) To provide more public latrines, thereby obviating promiscuous defœcation. (5) To clean out the water collecting tank more frequently during the rainy season, when doing so would be unattended by inconvenience to the people. (6) To erect a bathing platform with a good big trough for the convenience of the people, thereby preventing their crowding about the hydrants for this purpose. (7) To have the graves of the Mahomedan dead dug deeper than four feet, and to keep the Police informed of all interments and cremation. (8) To employ a Municipal vaccinator, and to have his work supervised by the Superintendent of Vaccination. (9) To take steps for bringing into operation the Compulsory Vaccination Act V (B.C.) of 1880. (10) To fully utilize the provisions of the Compulsory Registration Act IV (B.C.) of 1873; to appoint specially a person to detect evasions of the law; and to get the chowkidars and constables punished under section 6 thereof if they omit to report births and deaths occurring in their beats.

Action taken on the suggestions.—The seats of the latrines have been tarred; but the carrying out of the other suggestions being expensive, they will receive consideration when the budget for the ensuing year is prepared.

Dacca Town.—*Inspected in August.*—The sanitary arrangements of this town were found to be unsatisfactory. Although some improvements had been effected in conservancy and some of the abominable "gors" had been filled up, there were still several grave defects which called for urgent attention. The drainage arrangements were very defective About half the town was being supplied with filtered water, while the arrangements for the supply of water in the other half were unsatisfactory and in some places objectionable.

The suggestions were—(1) To bring into operation all the parts of the new Municipal Act III (B.C.) of 1884, particularly Part IX. (2) To water regularly the streets during the dry weather to prevent the metal from springing. (3) To encourage all possible extension of the Buckland bund towards the west, as it would be a great improvement to the town. (4) To consider the advisability of raising a loan for giving effect to the drainage scheme, or, if this is not practicable, of undertaking the work piecemeal year by year. Till the scheme is carried out, to attend to the cleanliness of the existing drains, to do away with all shallow hollows in lanes, and to provide continuous drains properly levelled. (5) To strengthen adequately the conservancy establishment, as the existing one is insufficient to meet the requirements of so large and populous a town as Dacca. (6) To strictly prohibit the mehters from performing work on their own account. (7) To have surface cleansing fully and regularly attended to, all the bye-roads and lanes receiving attention in this matter. (8) Not to permit street sweepings, house refuse, litter, &c., to be accumulated in improper places, but to have them collected in selected places and utilized in filling up low lands. (9) To proceed perseveringly with the work of filling up the "gors." (10) Not to permit cattle dung to be accumulated at the mehter's shed and bullock depôt at Sootrapore, or elsewhere, but to have it dried for fuel or removed. (11) To provide the bullock depôt at Miranjillah with a pucca floor as soon as possible, as at present the general surface becomes muddy and broken. (12) To provide separate latrines for females. (13) To have the defect in respect to the seats in the corrugated iron latrine being exposed to view of persons passing through the passage of the latrine from one entrance to the other rectified. (14) To introduce iron latrines instead of masonry ones in those parts of the town not yet provided with public latrines, placing them when required to be permanently set up on cemented floors; and to put up one, with quite separate seats for males and females, in the centre of the locality, where a "gor," surrounded by a small number of houses, is being filled up. (15) To consider the subject of keeping on hand a few of these iron latrines, constructed on a small scale suited for

single families, so that when householders apply to the Municipality to construct latrines for them, these latrines could be supplied at their cost. (16) To construct, in place of the present masonry ones, corrugated iron urinals, consisting of a long sheet bent round acting as a shelter, and one small sheet curved and so placed that the urine would run from it directly into a bucket placed in a masonry well, cemented with Portland cement. (16) To have the gumlahs used in the latrines tarred periodically. (17) To induce the owners of such privies as are situated close to cook-rooms, sleeping apartments, or on the roofs of houses, to remove them to other unobjectionable sites. (18) To make every endeavour to suppress the remaining well-privies. (19) To have only so much night-soil placed in the trenches as, with a layer of earth over it, will not reappear on fermentation. (20) To decide on the relative position of the proposed trenching ground to the new railway buildings. (21) To require the owners of the Committeegunge and Rai Sahib's bazars to remedy the defects pointed out in connection with the drains. (22) To establish a properly constructed slaughter-house for the town. (23) To give attention to the ill-conditioned cattle that are slaughtered in the town, so that the supply of wholesome meat may be secured. (24) To have the wells which are situated near the bank of the river filled up with earth taken from the dry bed of the river in the cold season. (25) To close the Begum bazar well, which is said to be a very bad one. (26) To induce the owners of private burial-grounds to keep them in good order, and to attend to the ruinous condition of the cemetery for the Greeks. (27) To prevent inoculation, which it appears is practised clandestinely. (28) To utilize fully the provisions of the Compulsory Registration Act, and to adopt measures generally for the improvement of registration of births and deaths.

Naraingunge.—*Inspected in August.*—Decided improvement was observed to have been effected in this town since it was last inspected with regard to roads, construction of houses, and particularly conservancy, indicating that the Commissioners are not unmindful of their charge. But much yet remains to be effected before the town can be said to be in a proper sanitary condition. It is to be regretted that the Naraingunge Improvement Committee has abandoned its schemes involving sanitary improvements.

The suggestions were.—(1) To allot a larger share of the income in improving the sanitary status of the town. (2) To utilize all the parts, particularly Part IX, of the new Municipal Act III (B. C.) of 1884, and to frame and bring into operation a proper code of bye-laws. (3) To undertake systematically the filling up of swamps, stagnant water-holes, and cesspools, which abound in the town, and in doing so to limit the filling up process to one excavation at a time, attention being particularly directed to hollows among clusters of houses, and where it is possible allowing river water to run in and out of them. (4) To move the Railway authorities and Government Engineers to fill with river mud during the cold season all hollows and excavations on the lands they have taken up for public purposes, and to induce the landholders to act similarly. (5) To remove all obstructions in and encroachments over side drains and to maintain the drains in an effective working over. (6) To provide more public latrines without delay, and to consider the subject of bringing into use the iron latrines in use at the Committeegunge bazar at Dacca. (7) To provide separate latrines for females. (8) To have the gumlahs in the latrines and the drains and walls up to three feet high tarred periodically. (9) To provide wheel and hand-barrows for the conservancy of the lanes and narrow roads to which the regular carts cannot have access. (10) To carry out dry-earth system properly in the public latrines. (11) To provide public urinals in convenient parts of the town. (12) To extend Part IX of the new Municipal Act III (B.C.) of 1884, containing provisions for the management, &c., of public and private latrines, to the whole town as soon as possible, and to induce the owners of the latrines situated on the bank of ditches, old tanks, and other holes, to provide in their places proper privies constructed in the manner suggested in the last Inspection Report. (13) To induce the owners of the private markets to provide proper drains, floors, and latrines in them. (14) To make provision in next year's budget for the construction of a suitable slaughter-house. (15) To bestow attention to the suggestions regarding the water-supply of the town made in the last Inspection Report. (16) To provide public burial-grounds without delay, and when these shall have been established to prohibit strictly intramural interments. (17) To put a stop to the practice of throwing the Hindu pauper and lunatic dead into the river Megna. (18) To cause ashes to be laid down throughout the cooly lines belonging to Messrs. David & Co., and to draw the attention of the Manager of the said Company to the imperfect cleansing of the latrines in the cooly lines,and to instruct him to bring neglect on the part of the sweepers to the notice of the Vice-Chairman. (19) To utilize fully the provisions of the Compulsory Vaccination Act. (20) To adopt measures for the improvement of registration generally.

Hughli and Chinsurah.—*Inspected in November.*—Since the town was last inspected much improvement had been effected under every branch of sanitation, and there was evidence to show that the Commissioners bestow commendable interest on the sanitary concerns of their charge. On the whole, however, the sanitary arrangements of this town cannot yet be said to be quite satisfactory. There were several sanitary defects, particularly under the heads of drainage and water-supply, which called for early attention. A proposal had been under the consideration of the Commissioners for the supply of filtered water to the town, but nothing is yet known as to the conclusion arrived at.

The suggestions were—(1) To devote each year a larger share than at present of the income in improving the sanitation of the town. (2) Not to lose sight of those portions of

the new Municipal Act which relate to building regulations, European drug shops, milkmen, a water-supply scheme, and Municipal markets and slaughter-houses. (3) To frame, on an early date, a new code of bye-laws under the new enactment. (4) To utilize the rubbish available from clearances made in constructing the line towards the new railway bridge for filling up hollows and the large number of foul tanks about the town. (5) To provide a drain for the public distillery to carry off the refuse fluid which stagnates outside and is offensive (6) To construct saucer-shaped drains in the place of the old Dutch drains in Chinsurah, which are said to be in disrepair and silted up at places. (7) To have the lanes and bye-paths daily swept and cleaned, wheel or hand-barrows being used for the removal of rubbish. (8) To repair the cattle-shed before the next rainy season sets in. (9) To provide more public latrines. (10) In constructing public latrines, to have, where possible, the accommodation for males and females in separate buildings, with perfectly distinct approaches, and to cause the latrines for females to be attended to by mehtranis. (11) To provide two gumlahs in each of the cells in the latrines. (12) To set up in different parts of the town urinals consisting of a long sheet of corrugated iron bent round, acting as a shelter, and one small sheet curved and so placed that the urine would run from it directly into a bucket placed in a masonry well, cemented with Portland cement. (13) To extend to the remainder of the town Part IX of the Municipal Act, and to cause all the private latrines to be attended to by the Municipal mehters. (14) To carry out the system of trenching night-soil in a proper and inoffensive way. (15) To get portions of all the trenching grounds cultivated in rotation. (16) To invite the attention of the owners of private markets to remedy the defects in connection with their floors, drains and pathways. (17) To consider the ways and means of providing a pure water-supply for the town. (18) To make proper arrangements in the Mahomedan burial-grounds, so that the graves may be dug in lines and at regular distances. (19) To discourage burials in the two grounds near the Emambara, as they are somewhat crowded and situated too near human habitations. (20) To induce the Mahomedans to dig the graves for their dead deeper than five feet, so as to admit of the chupper usually placed over the corpse being at least four feet from the surface of the ground. (21) To try to induce the Mollahs in the Mahomedan burial-grounds to keep registers of the deceased brought for interment. (22) To utilize fully the provisions of the Compulsory Registration Act, and to adopt measures for the improvement of registration generally.

Serampore.—*Inspected in November.*—The general condition of the town was found to be bad, and parts of it were in such a state that outbreaks of cholera might have been frequently looked for. In fact it was jungly, badly drained, interspersed with old tanks and holes full of foul water; its conservancy was unsatisfactory; and the bustees required a great deal of attention.

The suggestions were—(1) To attend to the subject of allotting, year by year, a legitimate share of the income for the purpose of placing the town on a sound sanitary footing. (2) To utilize the omitted sections of Part VI of the new Municipal Act, which relate to the building regulations (3) To frame a new code of bye-laws under the new Act, and to bring it into operation when called for. (4) To carry on perseveringly the work of filling up offensive small pits and hollows. (5) To keep the existing drains in working order, and to correct the defects in the construction and level of the drains in some of the smaller streets and lanes, and to provide drains in those lanes which have none. (6) To carry out perseveringly the proposal which has been decided on by the Commissioners of constructing year by year pucca saucer drains in place of the existing deep ones. (7) To take into consideration the amount of work to be exacted from the conservancy establishment, who appeared not to perform sufficient work. (8) To look after the overseer, who seemed to be lazy and inefficient. (9) To have the whole of the streets as well as the lanes and bye-paths swept daily. (10) Not to permit the urine from the cow-sheds to run into the public drains or to soak into the ground on the spot, but to have it removed bodily and put into trenches in the night-soil ground. (11) To provide more public latrines, as the present number is quite insufficient for the requirements of the town. (12) To attend to the subject of the existence of a large number of deserted mud houses, which are said to be used by certain classes of people for purposes of nature. (13) In constructing latrines to have the accommodation for the females entirely separate from that for males, in different enclosures, with different entrances. (14) To improve some of the existing latrines in the manner pointed out during inspection. (5) To provide, in addition to the one for fœces, another gumlah in each cell of the latrines for urine and washings. (16) To have all the gumlahs in the public latrines tarred periodically. (17) To bring into operation Part IX of the Municipal Act III (B C.) of 1884 in the Rishra, Connaghur and Mohesh wards, and pending its introduction to have the private privies in these wards properly looked after in view to their being kept in a clean and wholesome condition. (18) To carry on the trenching of the night-soil in a proper and inoffensive way. (19) To establish more trenching grounds for the convenience of the Chatra, Connaghur, Rishra and Mahesh wards. (20) To have the cooly bustee opposite the Hastings Mill properly drained and provided with roads; drinking water separately, and not from the same source as that used for bathing and washing clothes; and ample, well-supervised latrine accommodation, the houses so constructed as to permit free ventilation. (21) To improve and enlarge gradually the present municipal market. (22) To induce the owners of the private markets to rectify the defects in them in connectionwith their floors, drains and water-supply. (23) To join in the

scheme for the provision of good filtered water to the riparian towns, from Serampore downwards to Howrah. (24) To close, under the provisions of the law prescribed for the purpose, all the private burial grounds, some of which are inside the enclosures of houses. (25) To lay out the graves in the burial-ground at Mullikpara in a more orderly manner, and to have the graves dug at least six feet deep to allow of the chupper which it is customary to place over a Mahomedan corpse, being four feet from the surface of the ground. (26) To have the Hindu pauper dead burnt and not buried, and to make provision for the cremation or interment of those who die from contagious diseases. (27) To fully utilize the provisions of the Compulsory Registration Act, and to adopt measures generally for the improvement of registration of births and deaths.

Howrah.—*Inspected in November and December.*—Much had been done to improve the sanitation of this town, but there were yet several very serious sanitary defects, particularly under the heads of drainage, water-supply, and the conservancy, &c., of bustees. It was evident, however, that the sanitary interests of the town engaged the active attention of the Commissioners. The question of supplying this important town with good water had been long and was even at the time of my inspection under consideration.

The suggestions were—(1) To bring into operation the omitted parts of the new Municipal Act, and to frame a code of bye-laws under the new Act. (2) To prevent the throwing of house and kitchen sewage on the ground to soak in and attract flies, but to have it removed in carts, run into trenches, and covered over with earth at the trenching grounds. (3) To provide more public latrines, so that the whole town may be affected by these conveniences, and promiscuous defæcation effectually prevented. (4) To provide separate buildings for females near the Arkutti and Golabari latrines, or to make such arrangements in the present buildings as would afford seclusion for the females who resort to it, which is very desirable. (5) To have the corrugated iron sides in the two latrines belonging to the Howrah Mills Company tarred periodically. (6) To put the dirty and unsightly mat enclosure behind the latrine close to the entrance to the Botanical Gardens, belonging to the Seebpore College, and used by the natives, into better condition. (7) To see that the latrine on Major Ramsay's plan at Sat Bigha bustee is used in the manner it is designed to act, that is, moved about regularly, and that its offensive condition is corrected. (8) To carry out the process of trenching night-soil according to the instructions given to the Secretary, and to have the work constantly supervised by the Municipal officials and the Civil Surgeon, who is the sanitary officer of the town. (9) To have the bustees properly drained, provided with good roads and facilities for conservancy, and to prevent overcrowding in them. (10) To attend to the filthy condition of the pucca drain in the Arkatti bustee. (11) To repair the latrine in the Municipal market. (12) To attend to the broken condition of the side-drains in, and to remove the heaps of rubbish lying about, Seal's market, and also to remedy the filthy condition of the drains in the Sulkea market. (13) To bring to a final issue speedily the question of supplying the town with good water; and, till this is done, to keep the reserved tanks and the river free from pollution, and to induce the people to keep their wells and tanks in a wholesome condition, and to fill up the numerous small foul water tanks with earth from the river sides. (14) To take up as early as possible another site for a Mahomedan burial-ground in the neighbourhood of Sitanath Bose's Lane. (15) To fully utilize the provisions of the Compulsory Registration Act, and to adopt measures generally for the improvement of registration.

APPENDIX No. V.

STATEMENTS EXHIBITING PARTICULARS REGARDING THE VACCINE OPERATIONS OF THE YEAR 1884-85 AND OTHER INFORMATION CONNECTED THEREWITH.

STATEMENT No. I.—*Showing particulars of Vaccination in each*

Number.	Circles and Districts.	Population.	Average population per square mile.	Average number of vaccinators employed throughout the season.	Total Number of Persons vaccinated. Males.	Females.	Total.	Average number of persons vaccinated by each vaccinator.	Primary Vaccination. Total. Males.	Females.	Total.	Successful. Under 1 year.	1 year and under 6.

OFFICE OF THE SANY. COMMR. FOR BENGAL,
The 15*th May* 1885.

R. LIDDERDALE, M.D.,
Deputy Surgeon-General,
Sanitary Commissioner for Bengal.

Reg. No. 1114J—4'0—29-7-85.

MUNICIPAL DEPARTMENT.

SANITATION.

DARJEELING, THE 31ST OCTOBER 1885.

RESOLUTION.

READ—

The Report of the Sanitary Commissioner for Bengal for the year 1884, including the Report on Vaccination in Bengal for the year 1884-85.

Read again—

The Reports for the previous year, and the Resolution recorded upon them.

The present Report is submitted by Dr. Lidderdale, who was in charge of the office of Sanitary Commissioner throughout the year. It was not received until the end of July, and the delay in its submission is said to have been chiefly due to irregularities in the office of the Sanitary Commissioner, which have since been removed. It is again urged that the 1st May, which is the date fixed for the submission of the report, is "too early a one, with which it is almost impossible to comply, and which does not give a fair time for the proper compilation and digest of statistical and other information given." No doubt the submission of the Vaccination Report with the Sanitary Report has much to do with the delay, since the former, unlike the latter which is for the calendar year, is for the official year which terminates on the 31st March, and there is barely time between that date and the 1st May to check and compile the reports and statistics of each circle of vaccination, and to submit a proper report on the whole in a printed form; but there appears to be no reason why, since returns of the work performed in each circle are now submitted monthly, and the vaccinating season has been curtailed, the annual report cannot be drawn up and submitted much earlier than it has been for the last three years. Its earlier submission would certainly be facilitated by a reduction in its bulk. The length of the report has steadily increased during the last four years. The report for 1881 occupied 73 pages (exclusive of appendices and tables); that for 1884 has extended to 187 pages. In the Resolution on the Report for 1883, the disproportionate attention paid to vaccination by the Sanitary Department was commented upon. But this subject occupies 64 pages in the present report, as against 37 in the report for the previous year. Several other subjects are treated at needless length; and while the Lieutenant-Governor fully recognizes the care and industry bestowed on its preparation, he is satisfied that it would be an advantage to every one if, with the omission of a great mass of details, the necessary information could be compressed into a smaller compass.

2. The year 1884 was characterised by drought in nearly all the districts of the Province, particularly those of the Burdwan and Patna Divisions, where the distress among the people was so great as to necessitate the adoption of special relief measures which were carried on to the end of the year. In Durbhunga a grant of Rs. 5,000 in aid of the road cess funds was sanctioned by Government for expenditure on relief works, and the Board of Revenue were authorized to suspend the collection of rent in those Government estates in the district of Gya in which distress was anticipated by reason of the failure of crops. The rainfall, which was unseasonable and irregularly distributed, was again much below the average, being 57·56 inches against 64·70 inches, the average of previous years, and, as a consequence, the harvest partially failed, giving rise to a considerable advance in the prices of food-grains, particularly common rice, the price of which rose from Rs. 1-10-6

per maund, the average of previous years, to Rs. 2-8-1 per maund in 1884. Notwithstanding the great scarcity and the high prices of food, it is a noticeable feature in the sanitary history of the year that the health of the people throughout the Province does not seem to have suffered. The Sanitary Commissioner records the opinion "that the prejudicial effects of a diminished food-supply with high prices were more than counterbalanced by a comparatively drier season proving beneficial to health."

3. Some advance was made in the registration of vital statistics during the year. The ratio of births per mille of population was 23·51 against 22·08, and that of deaths 20·83 against 18·82. The recorded death-rate, which is still of course very far from being accurate, is considered to be an indication of marked improvement in the registration of mortuary statistics, inasmuch as there was no unusual general epidemic prevalence of sickness to cause an increase in the number of deaths, and, according to local reports, "many deaths were unreported owing to chowkidars having left their villages to seek a livelihood elsewhere, by other labour, in consequence of high prices of food-grains caused by deficient rainfall having injured the crops." The Lieutenant-Governor is disposed to agree with the Sanitary Commissioner in referring almost the whole of the increase to improved registration. It is beyond question that public health was far better in 1884 than in 1882, when cholera raged with unwonted severity, and a deadly wave of fever passed over the greater part of the Province, yet the recorded death-rate in the past year (20·83) exceeds that recorded for 1882 (20·41) by ·42. The districts in which a marked improvement in registration is noticeable are Pubna, Balasore, Sarun, Faridpore and Monghyr. In Sarun, where the number of deaths recorded rose from 34,972 in 1883 to 49,971 in 1884, the *hath-chitti* or hand-book system was introduced, and is said to have worked satisfactorily.

4. During the year under review the provisions of the Compulsory Registration Act IV (B.C.) of 1873 were extended to the Bansberiah Municipality, in the district of Hooghly, and the Naihatti Municipality, in the district of the 24-Pergunnahs. The provisions of the Act, so far only as they relate to the registration of deaths, were also extended to the portion of the Darjeeling district which lies to the west of the river Teesta. The law is now in operation in 116 towns and one rural tract. Its provisions were, however, only enforced in 42 towns during the year. The total number of prosecutions was 396 with 316 convictions, against 297 prosecutions with 232 convictions in 1883. The largest number of prosecutions instituted was reached in Howrah, where 81 persons were tried for offences under the Act, 71 of whom were convicted. The results for the year show an improvement in the administration of the law, and the Lieutenant-Governor is pleased to learn that in some towns "the absence or paucity of prosecutions is due to the people spontaneously and regularly reporting the occurrence of births and deaths among them, and thus giving no occasion for the exercise of the clause of the law, prescribing a penalty for evasions, and that, moreover, in some municipalities special agency has been engaged to detect cases of non-compliance by the people with the requirements of the law." The Lieutenant-Governor recognises the fact that, so long as the work of registration in municipalities is done by the police, Municipal Commissioners are not likely to take any active interest in the subject. He is glad therefore to learn that several municipalities have already taken this work into their own hands, and he trusts that, as this practice becomes more general, the co-operation of the Municipal Commissioners will ensure rapid improvement in the registration of vital statistics in their respective towns.

5. The registration of births was carried on in 47 towns with a total population of 1,685,651 persons during the year, against 46 towns with a total population of 1,685,159 in 1883. The recorded number of births, exclusive of 1,437 children still-born, was 39,640, or a ratio of 23·51 per mille of the total population under registration, against 37,215, or a ratio of 22·08 recorded in the previous year. The record of the number of births is still very defective, and, compared with the number of deaths recorded in the same area, it is

shown to be less by 10,709, or a ratio of 6·35 per mille of population. The following are the towns in which the best results were obtained:—

	1884.	1883.		1884.	1883.
Jamalpore in Monghyr	49·39	49·17	Bankura	33·55	34·93
Kondrapara	46·91	25·54	Revilgunge	32·41	37·30
Brahmenberia	37·45	33·46	Serampore	31·02	26·79
Bettiah	35·17	30·47	Durbhunga	29·57	24·32
Jamalpore in Mymensingh	34·49	34·24	Gya	29·41	29·38
Bhagulpore	33·88	33·64			

In all these towns, with the exception of Bhagulpore, Seramporo, and Gya, the recorded number of births exceeded the number of deaths. The percentage of male to female births was 116 against 114 in the previous year.

6. Of a total population of 66,163,884 persons within the area in which the registration of deaths was carried on, 1,378,610, exclusive of 20,015 still-born children, were reported to have died during the year, showing an increase of 132,934 compared with the number reported to have died in the previous year. The ratio of deaths to population was 20·83 against 18·82 in 1883. The increase in the death-rate was, as noticed above, mainly due to greater interest having been taken in the registration of deaths, especially in the rural circles. The following table exhibits the death-rate from specific causes for the year under review, compared with that for the previous year and the quinquennium 1879—83:—

Name of Disease.	Proportion of deaths per 1,000 of population.								
	In 1884.			In 1883.			In 1879—83.		
	Urban.	Rural.	Province.	Urban.	Rural.	Province.	Urban.	Rural.	Province.
Cholera	3·81	1·96	2·03	3·64	1·27	1·36	3·47	1·52	1·59
Small-pox	1·10	·24	·28	·27	·14	·14	·65	·27	·28
Fevers	12·89	14·66	14·60	13·77	13·81	13·81	15·50	12·26	12·38
Bowel-complaints	3·24	·79	·88	3·54	·73	·83	3·89	·70	·82
Injury	·44	·36	·37	·40	·35	·35	·42	·33	·33
Other causes	5·91	2·54	2·66	5·64	2·18	2·30	5·79	1·73	1·89
Total of all causes ...	27·43	20·58	20·83	27·28	18·49	18·82	29·72	16·82	17·30

There was an increase in the mortality recorded under every head of disease, especially under cholera, fevers, and the maladies classed under "other causes." Most of the increase was contributed by the rural circles. The Sanitary Commissioner observes that, "where registration has been improved, the opinion is growing that the rural circles, characterized by the existence in them of unchecked morbific influences stimulated by primitive filthiness of habits of the people, &c., are unhealthier than the urban circles in which corrective precautions are observed." The experience of the year again showed that the fourth quarter of the year, immediately after the rains, is the most fatal to life. The two worst months were November and December, and October came fourth in the death-scale, the most prevalent diseases being, as usual, fevers and bowel-complaints. The months of April and May were marked by the prevalence of cholera and small-pox, which caused the death-rate for these months to rise considerably above the death-rate for the same months in the previous year. The mortality among infants was higher than usual, the ratio having been 117·90 against 99·22 in 1883. The death-rates per mille of population according to class or nationality were—Christians 13·61, Hindus 20·26, Mahomedans 22·48, Budhists 13·79, and "Other races" 15·21.

7. As in the previous year, the birth-rate in Calcutta was lower and the death-rate higher than in the other Bengal towns. The ratio of births was 19·18 and of deaths 30·59. The increase in the number of deaths occurred under cholera and "Other causes." The mortality in the cantonments in Bengal, among a total population of 33,346, rose from 21·50 per mille in 1883 to 24·35 per mille in 1884. The mortality was again highest in the Hazaribagh Cantonment, where the death-rate rose from 61·16 per mille in 1883 to 129·41 per mille in the year under review. Of 21,182

European seamen who visited the Port of Calcutta during the year, 2,026 were admitted into hospital, of whom 76 died from various causes, chiefly from cholera, the number of deaths from which cause was 36. Besides these, there were 31 deaths which occurred out of hospital. Compared with the statistics of the previous year, the death rate among the European port population was 63·53 per mille against 48·92. Of the native floating population. estimated at 25,409 at the census of 1881, 301 resorted to hospital, of whom 62 died while under treatment. Among this number 38 died from cholera. Outside hospital there were 135 deaths, 100 of which were from cholera. This disease appears to have afflicted the native floating population very severely, "the deaths from it amounting to no less than 70·05 per cent. of the total loss of the year."

8. During the year under review, cholera prevailed to a much greater extent, and with more fatal effect, than in the previous year. The number of deaths recorded was 134,421, or at the rate of 2·03 per mille of the registered population, against 90,439, or a rate of 1·36 per mile of population in 1883. The disease was "present in every district, and pervaded 24,621 villages against 16,316 in 1883, prevailing epidemically in 90 of the registering circles against 47, and with conspicuous severity in 90 against 64; while 432 against 491 circles enjoyed much immunity, and 37 against 46 were entirely free from the pest." Of the total number of deaths, 9,390 were contributed by the urban and 125,031 by the rural circles. The districts in which the disease prevailed with the greatest severity were Balasore (7·79), Nuddea (5·79), Faridpore (5·34), Moorshedabad (4·99), Rajshahye (4·95), Backergunge (4·63), Cuttack (4·16), Dacca (3·85), 24-Pergunnahs (3·57), Pooree (3·52), Jessore (3·38), and Pubna (3·36). In all these districts the death-rate was higher than in the previous year.

9. Thirty-four pages of the report are devoted to the history of cholera during the year; but the observations made in different districts appear to have led to no new discoveries on the subject. As usual, the disease was most fatal in the hot, dry months, and local insanitary conditions fostered its development. With a few exceptions, all the northern districts were comparatively free from it. It is a common idea that the disease is disseminated by pilgrims who carry it with them in their journeyings from district to district. This point was made the subject of special investigation by the Sanitary Commissioner, who, after a careful examination of the cholera statistics of those districts which are traversed by pilgrims, records the following opinion:—

> "I think it unfair to infer that cholera is disseminated by pilgrims *per se*, or that they communicate the disease wherever they go. The fact is that when cholera, engendered by causes not yet definitely determined, and fostered by climatic influences or local insanitary conditions, is prevailing in any locality, pilgrims, if present there, suffer in common with the local residents, often more severely owing to fatigue, old age, debility, bad food or water, crowding, &c.; but they do not import or communicate the disease. They, however, continue to suffer during their onward journey, if the wave of the disease is travelling in the same direction, and the people residing in the localities traversed by this wave also suffer along with them. The disease appears in places far removed from pilgrim routes, and it is during the dry months that it prevails with intense severity, generally in every district in Bengal Proper, whether pilgrims are present in them or not during that period."

A remarkable circumstance in the cholera history of the year is that in a very few instances was the disease found to have manifested itself in the crowds of people who assembled at the public fairs held for days together in the districts. This is attributed to the sanitary precautions adopted. Some noteworthy efforts were made to arrest the progress of cholera in places where it appeared in a virulent form. Special mention is made of the measures adopted by Mr. Collier, the Sub-Divisional Officer, and Dr. Barker, the Civil Surgeon of Serampore, and of the help rendered them by Mr. Finlay of the Hastings Jute Mills, in mitigating the severity and checking the spread of the disease in that town. The remarks made by the Sanitary Commissioner in paragraph 93 of his report, regarding the necessity for an improved water-supply at Pooree, have been communicated to the Public Works Department, and the question will be considered by the Lieutenant-Governor when at Pooree during his approaching visit to Orissa.

10. In examining the cholera mortality in the 24-Pergunnahs during the year 1884, the Sanitary Commissioner remarks—

"The Suburbs of Calcutta again heads the list with an increase in mortality of nearly one per 1,000 of population, as compared with the death-rate of 1883. The mohullahs in it which formed the scene of greatest suffering were Balliaghatta, Entally, Bhowanipore and Watgunge. This Municipality was specially inspected by me and found in an extremely insanitary condition. A report embodying the defects and indicating remedies was sent to the Commissioners, and a copy thereof submitted to Government. An abstract of this report, with a note of the action taken by the Commissioners on the suggestions therein made, will be found in Appendix III to this report. Some of the officers of the Vaccination Department visited the Suburbs of Calcutta and several of the other localities where exceptional mortality from cholera occurred. Assistant Surgeon Priumber Mitter, Deputy Superintendent of Vaccination, Metropolitan Circles, records the following observations in connection with some localities in the Suburbs and in the North and South Suburban Towns. *Manicktollah* is the most filthy part of the Suburbs, the land behind houses being used as public latrines. In fact, all the bustees in this area are in an extremely insanitary condition from *fæces* and house refuse, lying on the roadsides, lanes and bye-lanes, and the ponds, hollows, and low lands being the receptacles of liquid sewage and filth. *Garden Reach.*—All the bustees here are in a similar insanitary condition with regard to conservancy, drainage, roads, &c. *Sett Bagan and Ghose Bazar.*—In these and the neighbouring bustees foul water holes, containing decaying vegetation, abounded; there are many filthy private privies; the water in two large tanks was filthy, green in colour and turbid, and two of the smaller ones were covered with decomposing plants, their sides lined with rank vegetation, the water in them 'appearing like vegetable decoction emitting disagreeable odour.' *Ballygunge.*—Here the waste lands were found to be covered with litter and other refuse, and were resorted to for defæcation. *Gangarambusti and Wolfutbazar*—These were found in their usual state of uncleanliness without any arrangement for the removal of sewage and refuse. *Matiabrooj, Mooriali and Kanchisharak* were so crowded as to prevent free perflation of air, and their courtyards and compounds were extremely filthy. In *Ekbalpore* some of the drains were filthy and obstructed, and the cowsheds full of decomposing litter and refuse. *Baniapooker.*—Here the drains were filthy and emitted a sickening odour, and the ditches and low lands covered with *fæces*, rank vegetation and refuse of every description. The water-supply in all its bustees was bad, drinking-water being taken without any regard as to its quality; many of the houses were deficient in ventilation, the ground about them damp, and no arrangements existed with regard to house scavenging. *Bhowanipore.*—This place was in an indescribably insanitary condition, and its bustees do not admit of free scavenging. The tanks are foul and the drains, with few exceptions, are defective in level. *Watgunge.*—Some of the ditches here contained weeds, house sweepings, and human excreta, and the receptacles in one of the latrines were overflowing with *fæces* emitting an abominable odour. *Kalighat in Tollygunge.*—Although some improvements had been effected, the sanitary condition of this locality is yet very defective with regard to scavenging, cleanliness, ventilation and crowding of huts. The latrines were most filthy, the vessels in them overflowing with decomposed bubbling *fæces* seats unclean, and the latrine too near a much-used tank belonging to the police. The remarks of Dr. Ghose, the Officiating Deputy Sanitary Commissioner of the Metropolitan Circles, who also visited most of the above-named localities, are equally condemnatory. His reports also expose many extremely insanitary conditions obtaining at Cossipore, Baranagore, Barripore and Joynuggur thanas, and Baraset Municipality. I would be extending my Report to an undesirable length were I to reproduce all the defects disclosed in the reports of the Officers of the Vaccination Department. It will suffice to say that the above description applies *mutatis mutandis* to several other localities in the Suburbs, one of the largest and most important of the Municipalities in Bengal, and to other towns and thanas in the Province. It may be noted here that some judicious recommendations made by Dr. Ghose, after careful inquiry and inspection of several bustees in the Suburbs, do not appear from his later reports to have been followed by any action on the part of the municipal authorities."

It seems to the Lieutenant-Governor that it would be impossible for Government to approach the subject of a removal of these horrible conditions in different parts of the Suburban Municipality till the question of amalgamation is settled. At the same time he is convinced that, if the Suburban Municipality is unable or unwilling to cope with the state of things revealed by the Sanitary Commissioner's report, it is only by the amalgamation that any effective reform can be secured.

These remarks, together with a copy of paragraph 299 of the Report, will be communicated to the Committee appointed to consider the question of the amalgamation of a portion of the Suburbs with the town of Calcutta.

11. Small-pox prevailed in a more virulent form during the year 1884 than in the previous year. "The reported number of casualties amounted to 18,533 against 9,714 and the proportionate death-rate to population to ·28 per mille against ·14 per mille. The disease prevailed with more or less severity in 53 circles against 30, and was absent from 224 against 284; and it invaded

2·96 per cent. of the villages against 1·73 per cent." Of the total number of deaths, 2,711 were contributed by the urban and 15,822 by the rural circles. The areas in which the disease was most severely felt belonged to the districts of Gya (10), Sarun (8), Patna (7), Chumparun (5), and Hazaribagh (7). The districts of Gya and Sarun have not yet been brought under the operation of the Vaccination Act, and this no doubt accounts for the high death-rates returned by them. The same may be said of Chumparun, which has been only partially protected; and although Patna was reported to have been almost thoroughly protected, the number of deaths from small-pox in that district seems to contradict this statement. As in the previous year, the mortality was highest among children; no less than 72·27 per cent. of the total number of deaths were those of children under 12 years of age. The record of the seasonal incidence of the disease confirmed the experience of former years that small-pox is most prevalent during the hot months of March to June.

12. The total number of deaths from fever recorded during the year was 966,233, or a ratio of 14·60 per mille of the registered population, against 913,766, or a ratio of 13·81 in 1883. The registered mortality from this cause has steadily increased year after year since 1871, when the recorded number of deaths stood at 169,505, or a ratio of 2·56 per mille of population. With regard to this return, the Sanitary Commissioner states that the numerical increase is due to the facts revealed by improved registration, and that no circumstances have occurred to "justify the belief that the Province *generally* is getting more feverish than before." Of the total number of deaths, 584,893 were registered in Bengal Proper, 301,302 in Behar, 26,523 in Orissa, and 53,485 in Chota Nagpore. The death-rate per mille of population in each of these areas was 16·67, 13·02, 7·30, and 12·34 respectively. The districts which suffered most from fever were Rajshahye (30·40), Nuddea (29·22), Pubna (27·45), Jessore (22·41), Bogra (20·96), Gya (20·81), Moorshedabad (20·25), Beerbhoom (19·53), Burdwan (18·81), Khulna (18·52), Julpigoree (18·25), and Rungpore (17·09). The experience of the year again showed "that the severity of the disease begins and progresses in intensity after the rains have well set in, and is most virulent in January, October, November, and December, especially in the two latter months, when the evaporation of moisture from the sodden soil is rapid and the daily range of temperature considerable." As in the case of cholera, "the relationship of fever with the quantity of rainfall has always been a constant phenomenon." The local reports continue to show that fever is found to be most prevalent in those districts in which the soil is saturated with moisture, and the land is loaded with decaying organic matter owing to obstructed drainage due either to artificial deposits, or to the silting up of the beds of rivers and khals. It is no doubt true, as reported from many districts in Central and Eastern Bengal, that the process of silting is steadily going on throughout a very wide area, and extending its influence on health from year to year. The effect of drainage on fever is strikingly exemplified in the case of certain villages visited by Dr. Ghose, Officiating Deputy Sanitary Comissioner, in the Midnapore district. On the inner side of the embankment, along the right bank of the Roopnarayan river, is a group of well-drained villages, in which "no vestige of malarious cachexia, is to be seen in the people;" while on the outer side of the embankment, "the people of churs Najooreh and Bilkota living on *churs* generally inundated during the rains have well-marked signs of malarious disease in them." The Lieutenant-Governor notices the frequency with which the steeping of jute fibre in tanks and water-courses is spoken of in the present report as a harmful source of pollution of water, and consequently a probable cause of much disease. The matter is one to which local attention should also be specially directed, and the point should be specially noticed in the next report. The water-supply stations on the Eastern Bengal Railway were specially reported on in August 1884, in consequence of which measures have been taken by the Manager to improve the supply at some of the most important stations, and other improvements are in contemplation. The remarks of the Sanitary Commissioner regarding the silting up of the Kana and Sarasati nuddees in the Hooghly district will be considered in the Public Works Department.

13. The mortality during the year from "bowel-complaints," "injury," and "other diseases" was 58,376, 24,674, and 176,373 respectively. Com-

pared with the statistics of the previous year, there was an increase under each of these heads, though not to a very noticeable extent. Under "injury" the largest number of deaths are again shown to have been occasioned by snake-bites and attacks of wild beasts. The recorded mortality from this cause was 10,393 against 9,776 in 1883. Accidents stood high in the list of casualties, the number having been 10,078 against 8,727 in 1883. Among "other diseases," heat apoplexy and scurvy caused more suffering among the European seamen who visited the port during 1884 than in the previous year.

14. The work of the Vaccination Department continued to progress during the year 1884-85. The total number of operations performed was 1,488,296 against 1,364,642, the number performed during the previous year, showing an increase of 123,654. Towards this increase the vaccination circles contributed 114,483 and the municipal area 9,171 operations, as exhibited in the following table:—

Circles.	Total number of vaccinations performed.		Difference in 1884-85.	
	In 1884-85.	In 1883-84.	Increase.	Decrease.
Calcutta ...	15,955	9,538	6,417	.....
Metropolitan Circles ...	366,139	342,543	23,596	......
Bovine Vaccination Department, Calcutta ...	4,760	3,310	1,450	......
Suburbs of Calcutta, including cooly depôt ...	15,021	14,397	624	......
Total of Metropolitan Circles ...	385,920	360,250	25,670	.....
Darjeeling Circle ...	229,560	221,536	8,024	......
Ranchi " ...	148,972	146,283	2,689	......
Sonthal Pergunnahs " ...	123,048	106,985	16,063	......
Eastern Bengal " ...	397,079	351,016	46,063	......
Orissa " ...	46,971	52,542	.....	5,571
Behar " ...	54,755	39,627	15,128	......
Total of Vaccination Circles ...	1,402,260	1,287,777	114,483	5,571
Municipalities, Dispensaries, &c. ...	86,036	76,865	9,171	......
Grand Total ...	1,488,296	1,304,642	123,654	5,571

Of the total number of operations in the year, 421,274 were performed by the Government agency, 976,226 by licensed agency, 4,760 by the Bovine Vaccination Department, and 86,036 by municipal vaccinators, dispensary medical officers, &c. Comparatively speaking, the largest amount of work was done by the Government vaccinators, each of whom performed on an average 1,280 operations. The licensed vaccinators performed on an average 915 operations each. It is believed that better results would have been obtained from the licensed system of vaccination, were it not for the difficulty which is experienced by the licensed vaccinators in realizing the fees for operations performed by them. It appears to the Lieutenant-Governor that this difficulty would not be felt, in places where the Compulsory Vaccination Act is in force, if in each case the fee were demanded before the operation was performed. The law, if rigidly enforced, would compel the people to seek vaccination, and the licensed vaccinators, to whom the people would have to go, would be able to refuse to perform the operation without prepayment. Protection was afforded for the first time by Government vaccinators to four thannas in the Tipperah district, two thanas in the Noakhally district, six thanas in the Cuttack district, and four thanas in the district of Shahabad. On the other hand, nine thanas in the district of Mymensingh, and the whole of the Patna district, were for the first time placed under the licensed system of vaccination, after having been traversed by the Government vaccinators. In addition to the areas protected in former years, the whole of the districts of Tipperah and Pubna, and parts of the districts of Manbhoom, Lohardugga, and Cuttack, were reported to have been thoroughly protected at the close of the season 1884-85. The Sanitary Commissioner, however, shows that the words "thorough protection" must not be construed too literally. Even in the Metropolitan Circles, in which the districts have been reported year after year to be "thoroughly protected," many whole villages have been found by Dr. Ghose, the Officiating Superintendent, which have up to this time successfully resisted vaccination. In the Midnapore district alone there are no less than 356 villages in which the whole or a large portion of the inhabitants are

still unprotected. Until the strong prejudices against vaccination, which still prevail in the minds of a considerable section of the population in all parts of the Province, are overcome, thorough protection, in the literal sense of the words, will be impracticable.

15. The following table exhibits the number of primary and secondary operations performed during the year 1884-85 in the different circles (including municipalities), and the percentage of successful cases under each:—

Circles.	Total number of vaccinations.	Primary Vaccinations.			Re-vaccinations.		
		Total.	Number successfully vaccinated.	Percentage of successful operations.	Total.	Number successfully vaccinated.	Percentage of successful operations.
Metropolitan	418,238	409,833	406,860	99·57	8,405	4,069	54·89
Darjeeling	234,453	234,180	231,750	99·68	273	207	76·95
Ranchi ...	150,966	150,879	146,357	99·03	87	53	63·85
Southal Pergunnahs ...	132,310	131,749	130,591	99·89	561	374	68·00
Eastern Bengal... ...	409,706	409,364	407,307	99·91	342	254	76·73
Orissa	51,367	51,240	49,306	96·91	127	65	55·55
Behar	75,301	74,837	71,773	97·31	464	184	34·47

The reason assigned for the comparatively small number of operations performed in the Orissa Circle is that the districts of Balasore and Pooree were excluded from the sphere of operations for the year, and that in some of the selected areas of the Cuttack district, vaccine operations had to be stopped in the middle of the season owing to an outbreak of cholera. In the Sonthal Pergunnahs Circle, where the work performed was unfavourably reported on in 1883-84, the number of operations rose considerable. The increase is said to have been caused by work having been carried on largely during the recess, to suppress outbreaks of small-pox in the Sonthal Pergunnahs, Bhagulpore, and Monghyr districts. It was also due in part to the exertions of the new Superintendent. The Lieutenant-Governor learns with regret that much of the work of the Government vaccinators in the district of Shahabad was retarded in consequence of an order issued by the Magistrate, permitting certain inoculators to vaccinate, and forbidding police interference with them. It appears that some of these men not only induced people to refuse vaccination by the Government vaccinators, but, under cover of the licenses granted to them, practised inoculation even in thanas where the prohibitory law is in force. The Lieutenant-Governor will await the result of the Sanitary Commissioner's enquiry into this matter. Compared with the figures of the previous year, there was an increase in the number of children brought under protection in the year 1884-85; but fewer adults were vaccinated than in the previous year.

16. During the year under review, the provisions of the Compulsory Vaccination Act were extended to the towns of Kotechandpore in Jessore, Deoghur, Sahebgunge, Dumka, and Rajmehal in the Sonthal Pergunnahs, Brahmanbaria and Commilla in Tipperah, Darjeeling, Cuttack, Bali in Howrah, Sherpore in Bogra, Patna, Durbhunga, Hazareebagh, Purneah, and Pooree, and to five thanas in Tipperah. The law is now in force in 81 towns, 4 cantonments, and 9 rural areas, and preliminary steps have been taken to extend it to the Chittagong and Sudharam municipalities. With a few exceptions, such as Gya, Monghyr, and Bhagulpore, the law met with comparatively less resistance in the places in which it was enforced during the year 1884-85 than in previous years. It is evident that the measure is being gradually more appreciated by the Mahomedans, and that the Rajpoots and Marwaris, who have always stoutly resisted it, are in many places less persistent in their opposition. In Burdwan, owing to the presence of small-pox, operations had to be carried on throughout the year, and it is stated that the Marwaris, who were at the outset strongly hostile to the measure, at last acquiesced and allowed their children to be vaccinated. Experience of the beneficial effects of vaccination is slowly, but surely, popularizing it wherever it is introduced: it is a work of time, and inoculation is still a powerful rival; but every year shows that the superiority of vaccination is more generally acknowledged.

17. A very large number of the operations during the year were performed with bovine lymph, which is still spoken of as "equal in operative power to humanized lymph." Its only drawback is that when stored in tubes it soon deteriorates, on account of the serum of blood which passes into the tube with the virus when squeezed from the vesicle on the calf, and when conveyed to long distances its efficacy is lost in consequence of this deterioration during transit. When used direct from the calf its efficacy is indisputable. On the whole, the work performed with this lymph was successful, and the Lieutenant-Governor is glad to learn that the prejudice against it entertained by the Hindus is dying out. The one great advantage which bovine lymph has over humanized lymph is that it is easily obtained, and that the supply is always equal to the demand.

18. The total amount expended on vaccination during the year 1884-85 was Rs. 1,51,448-14-4, exceeding the expenditure, in the previous year by Rs. 15,853-15-6. Of the total expenditure, Rs. 73,663-9 represent the cost of the operations performed by the Government vaccinators, Rs. 67,082-15-8 the cost of the establishment provided by Government for supervising the operations of the licensed vaccinators, and Rs. 10,702-5-3 the cost of vaccination to municipalities. In addition to the regular expenditure, Rs. 1,201-11, which were received as private contributions from various sources, were expended in aid of the work. The average cost of each successful operation performed by the Government vaccinators was 2 annas and 10 pies; that by the licensed vaccinators 1 anna and 1 pie; and that by the municipal agency 2 annas and 2 pies. On the whole, the average cost of each operation performed during the year was 1 anna and 8 pies, the same as it was in the previous year.

19. The percentages of municipal income expended on sanitary works and roads during the year 1884-85 were 38 and 19 against 34 and 18 respectively in the previous year. The districts in which the largest proportion of municipal income was devoted to improvements in sanitation were Julpigoree, Dacca, Hazaribagh, Burdwan, Pooree and Midnapore. The towns in the districts of Mymensing, Khulna, Bogra, and Noakholly were most deficient in this respect. The special purposes for which the municipal allotments for sanitation were expended during the year 1884, compared with the figures for the year 1883, are shown in the following statement:—

Nature of work.	Total cost.		Difference in 1884.	
	In 1884.	In 1883.	Increase.	Decrease.
	Rs.	Rs.	Rs.	Rs.
Conservancy, including latrines ...	3,99,293	3,07,951	91,342	
Ditto, establishment ...	2,82,206	3,25,860	..	43,654
Drainage ...	1,05,973	96,097	9,876	..
Water-supply ...	1,35,181	1,60,449	...	25,268
Disposal of the dead ...	8,341	7,629	712	.
Markets and slaughter-houses ...	24,042	16,533	7,509	...
Vaccination ...	12,481	10,992	1,489	.
Treatment of the sick ...	1,87,185	1,69,339	17,846	
Other sanitary works ...	78,087	53,080	25,007	. .
Total ...	12,32,789	11,47,930	84,859	68,922
Construction, maintenance, and repairs of roads ...	6,28,578	6,06,160	22,418	..
Total including roads ...	18,61,367	17,54,090	1,07,277	68,922

There was an increase of expenditure under all heads except establishment and water-supply.

20. Among the important sanitary works carried out during the year 1884, the Burdwan water-supply takes a leading place. The water-works were formally opened by the Lieutenant-Governor on the 4th November, and the regular supply of water commenced from the 1st December 1884. The beneficial effect of the improved water-supply on the inhabitants of the northern portion of the town where the pipes are laid, 99 per cent. of whom are said to use the water, is unquestionable. The Lieutenant-Governor trusts that it will not be long before the supply is extended to the southern portion of the town, the inhabitants of which still resort to the Banka Nulla and the Eden Canal. Very slow progress appears to have been made with regard to the proposed

water-supply scheme for all the riparian municipalities on the right bank of the Hooghly from Howrah to Serampore. The services of a Government Engineer have been lent for the purpose of preparing the necessary estimates, and it is hoped that some definite project will be adopted before the close of the current year. A scheme of water-supply for the town of Bhagulpore has been sanctioned by Government, and the work is being carried on as rapidly as possible. Some attention was devoted to the improvement of drainage during the year, but very much still remains to be done in this direction, and the Lieutenant-Governor trusts that the suggestions made from time to time by the Sanitary Department on the subject will not be disregarded by the local bodies to whom they have been communicated. During the year 1884, much attention was paid by the Government to the insanitary condition of Calcutta and its Suburbs, and steps were taken with the view of remedying the evils which have been shown to exist.

21. The Lieutenant-Governor observes with satisfaction the improvement in the amount of sanitary work performed by the officers of the Vaccination Department. The record of the observations made by these officers is interesting, and cannot fail to help on the cause of sanitation. The work of the Department affects the well-being of some 68 millions of people; and if the progress is slow, the result is due to the apathy and, sometimes, hostility of the people to any measure of reform, and to the cost involved in any practical schemes of improvement. There is also the fact that outside of municipalities there is no law by which the officers of the Department can enforce their remedies. Even, however, if the advice given to the inhabitants of the villages inspected is not immediately followed by action, it is in itself an advantage to the Province to have so many qualified medical officers thoroughly acquainted with the sanitary condition of the areas under their charge; and with the introduction of the Local Self-Government Act, when funds are made available for local improvements, the question of village sanitation should, at any rate in the more advanced districts, be taken up in real earnest. The detailed remarks of the Sanitary Commissioner upon his subordinates will be communicated to the Appointment Department for information. Finally, the thanks of the Lieutenant-Governor are due to Dr. Lidderdale for his report, which, though too lengthy and diffuse, is full of interesting and valuable information.

By order of the Lieutenant-Governor of Bengal,

J. WARE EDGAR,

Offg. Secretary to the Government of Bengal.

APPENDICES.

EIGHTEENTH ANNUAL REPORT

OF THE

SANITARY COMMISSIONER FOR BENGAL.

YEAR 1885.

SECTIONS I. II, III, & IV.

THE information required under these Sections is omitted from this Report as, under standing orders on the subject, it will be submitted in the Imperial Sanitary Commissioner's Report.

SECTION V.

VITAL STATISTICS.

Statistics dealt with in this Section.

2. IN this Section are considered the birth statistics of 46 principal Municipalities, and the mortuary statistics of the Province for the calendar year 1885.

REGISTRATION—Value of—in 1885.

Birth registration.

3. The aggregate number of Births registered in the 46 Municipalities amounted during the year under review to 41,133 against 39,640 in the preceding year, showing an increase of 1,493 Births. Considering the returns received from these Municipalities individually, I find that the 11 named in the margin recorded approximately correct results with reference to their populations, against 9 in 1884; that the 14, also cited in the margin, against 19, submitted defective returns; and that the remaining Municipalities—21 in number—presented birth-rates ranging from 19·48 to 29·54 per 1,000 of population.

Approximately correct results.

	Ratio per *mille*.
Jamalpore in Monghyr	53·23
Bhagulpore ...	40·41
Bettiah ...	38·28
Brahmanberiah ...	37·84
Kevilgunj ...	37·30
Shaikpura ...	36·03
Kendrapara ...	34·97
Sitamurhi ...	34·44
Gya ...	34·11
Patna ...	32·93
Durbhanga ...	32·42

Very defective results.

	Ratio per *mille*.
Cuttack ...	18·28
Midnapore ...	18·20
Kishnaghur ...	18·05
Dacca ...	17·00
Arrah ...	16·74
Ranchi ...	16·48

Darjiling ...	9·02
Faridpore ...	8·18
Ranaghat ...	7·94

Ratio per 1,000 of population.

1884.	1885.
23·51	24·71

4. On the whole, although the year under review presents results in advance of those of the preceding year, the birth record of the towns under notice is very defective; and this is to be much regretted, because the urban areas command many facilities for ensuring correct registration.

Death registration.

5. It was stated in the Report of 1884 that the results of death registration exhibited an improvement on those of all past years. The returns of the year under review

exhibit a further advance, for during it 1,504,745 deaths were recorded against 1,378,610 in 1884, showing that an excess of 126,135 deaths had been registered. Of the 45 districts in the Province, 15, against 10 in 1884, recorded approximately correct, and 12 against 22 defective results. These districts and the results returned by them are marginally noted. The returns of the remaining districts—18 in number against 13—show that deaths were registered in them at rates ranging between 20·05 to 24·72 per 1,000 of population. Of the 647 registering circles in Bengal, 8 against 4 recorded deaths at the rate of 50 and above per 1,000 of population; 22 against 25 at 40 to 50; 89 against 71 at 30 to 40; 324 against 271 at 20 to 30; and the remaining cirlces (204 against 278) at under 20.

Approximately correct results.	Ratio per *mille.*	*Defective results.*	Ratio per *mille.*

6 Distributing the number of deaths registered this year into the various heads of disease by which they were caused, it will be seen—*vide* figures in the margin—that, in comparison with the mortality during the preceding year, and with the average mortality of the quinquennium 1880-84, there was, small-pox excepted, an increase of deaths under every head. The year under review was decidedly an unhealthy one generally, particularly for cholera and fever; but considering that notwithstanding the casualties from cholera in 1876 (196,590) and in 1882 (182,352), and from small-pox in 1879 1880, and 1881 (22,843, 22,953, and 24,371)—diseases the incidence of which fluctuates very much—were considerably greater, still the total mortality in those years was far below that of the year under review, I maintain that the increase in the number of deaths in 1885 is not solely referable to the more fatal prevalence of diseases, but that a good portion of it, specially under the head of fever, has resulted from improvement in registration; and this inference is widely supported by local opinion.

	Number of deaths—			Increase or decrease as compared with 1884.	Increase or decrease as compared with the mean of 1880-84.
	In 1885.	In 1884.	In 1880-84.

All causes ...	1,504,745	1,378,610	1,230,410	126,135 *I*	274,335 *I*

Unreported Deaths.

7. It should be mentioned that many casualties referable to the cyclone and storm-wave in Orissa have had no place in this year's death-rolls owing to there being no persons to record them, the chowkidars having perished with the inhabitants, and that during the high inundations in many parts of Bengal they must have been unable to keep up their regular attendance at the registering stations. It is estimated that in Orissa alone about 15,000 persons met their deaths in this manner. The officers of the Vaccination Department have also reported large omissions in the record of deaths, prominent among them being the Superintendent of Vaccination, Sonthal Pergunnahs Circle, who found that in thanas Jumui and Sikandra in Monghyr, in Umerpore in Bhagulpore, and in Jamtara and Rajmehal in the Sonthal Pergunnahs, 353 deaths which occurred in the villages, had not been reported at the thanas. In Rungpore a large number of deaths were unrecorded, although since last year registration has advanced from 18·86 to 25·57 per 1,000. In the Singhi-Li-La range in Darjiling—a large tract—there is no registering agency.

Special measures adopted locally to improve Registration.

8. Under this head I propose to submit only such measures adopted during the year to promote registration as are worthy of record. Generally, the reports disclose that the verification of the thana death registers by the magisterial and superior police authorities was more extended and constant than usual; that the *hath-chitti* system was more energetically

enforced in several of the districts in which it is in operation; that a larger number of chowkidars was punished for omitting to report deaths; and that, in fact, the instances were not rare in which a lively interest was manifested in the cause of registration.

The *hath-chitti* system has been more generally adopted, and several Municipalities have taken, and some others propose to take, over the work of registration from the hands of the police. In some towns special agencies have been entertained to detect and report people for evasions of the Compulsory Registration Law. These are moves in the right direction, and have no doubt contributed to some extent in improving the returns of the year.

Monghyr.—Of all the methods adopted for the improvement of registration, the one introduced into this district possesses the greatest value, and is worthy of imitation generally. Under it the registration in Monghyr, which has been lamentably defective for years, has this year improved very materially—in fact the number of deaths recorded was more than double that of 1884, viz., 63,555 as opposed to 31,573, and the proportionate death-rate to population, 32·26 per 1,000, closely approximates the truth—while there was no reason to attribute the increase to any cause other than that of greater accuracy in registration, as no abnormal outbreak of disease is believed to have occurred. The credit of this is due to Major H. M. Ramsay, the District Superintendent of Police, who has for some years paid great attention to registration, the looking after which is a part of the duty of all Police Officers. I do not wish to convey the idea that Major Ramsay has devoted attention directly to death registration. The improvement brought about has merely followed his manner of controlling chowkidars, which enables him to obtain information specially required in his department of a more reliable kind than formerly. Improved mortuary statistics only followed a better mode of administration.

The plan followed by Major Ramsay in controlling and supervising registration is very simple. The pivot on which all the arrangements turn is systematic, punctual and regular attendance of the chowkidars with their reports at the thanas to which they are attached. The thana is divided into circles, and the circles into beats, and each circle and beat is given a number. The chowkidars are divided two into equal batches, one of which has to attend with the reports at a fixed hour every Monday, and the other every Tuesday. At the thana the chowkidars are mustered and sit in rows, each row representing a circle. Every man knows the numbers of his circle and beat, and when they are called out the right man stands up and delivers his report to the registrar. It is said that it takes about a minute to register each death. An absentee chowkidar is bound to send an efficient substitute.

Major Ramsay hopes that after he has picked out the careless chowkidars and made examples of them for the benefit of the others, he will be able to secure the registration of 95 per cent. of the actual deaths which occur in the district. He claims "to have satisfactorily undone, not cut, the Gordian knot represented by the duty imposed on the police officers of registering deaths," and he has had hard work in effecting this. He has, he says, been repeatedly complimented for years past on the results he obtains in every branch of administrative work, and these results have all more or less been brought about, he affirms, by his way of working the only machinery at the disposal of a Police Officer; and he solicits that, if his system is found after strict examination to be a good and sound one, it may be brought to the special notice of Government.

Mr. Marindin, the Joint-Magistrate of Monghyr, says from personal observation of the musters of the chowkidars held at the Jamui and Chakai thanas, that he was struck at both places with the full attendance, the discipline which was maintained, and the readiness and intelligence with which the chowkidars gave information; and that there was nothing unusual in what he witnessed, the men appearing as if only going through an ordinary parade to which they had been accustomed. He fully agrees with Major Ramsay in thinking that regularity and discipline at musters is the root of the matter, and that when this is secured the main difficulty against obtaining statistics, whether police or mortuary, is overcome, and

information will flow in a simple and regular stream. He believes that if Major Ramsay's scheme is properly worked it will secure satisfactory results; and, having given some attention to the matter, he thinks that it would be a wise step on the part of Government to call on Major Ramsay to embody his system in a few clear and concise rules for adoption generally throughout Bengal.

The present Magistrate, Mr. Jeffery, in forwarding Major Ramsay's report, observes that the improvement in registration in Monghyr has been attained simply by the attention he (Major Ramsay) has paid to enforcing the punctual attendance of chowkidars at the weekly thana musters, and to the methodical manner in which they are questioned and the answers recorded by the local police officers under the system. There has been no strained efforts to run up death registration, and information on other heads is equally called for and obtained from the chowkidars, but punctual attendance is insisted upon, discipline and order maintained at the musters, and method and intelligence have become the rule in inviting and recording information, with the natural result that improvement in the particular class of statistics has followed.

In the interests of registration I think this scheme a very important one, and worthy of general adoption. Indeed it would be well if Major Ramsay were deputed to Mymensing and other badly-registered districts to put the mortuary statistics on a fair footing.

Midnapore.—Much attention was bestowed on the subject in this district. In addition to the *hath-chitti* system which is in operation, the Police Officers, from Inspectors to Head-constables, were made to check registration by very frequently making independent enquiries of deaths in the villages, and comparing the result with the entries in the thana registers. This led to the detection of many omissions, and a considerable number of the defaulting chowkidars was prosecuted and punished. Some improvement in registration was effected; but the record, showing a death-rate of 20·40 per 1,000 of population, is still defective. It is, however, suspected that when for a short time communication between the thanas and villages was cut off by the inundation caused by the heavy rains, the work of registration was interfered with. In the Midnapore Municipality a special Registrar was appointed, and his returns were verified by the Ward Committees.

Rungpore.—In this district great pains was bestowed on registration by the District Superintendent of Police; and by the vigorous measures adopted, chiefly by punishing the chowkidars for neglect, the number of deaths recorded rose from 3,692 in August to 8,794 in December, and a large number of deaths was discovered by special enquiry to have been unregistered. Even after the completion of the annual statements, 2,250 were found to have been unreported. The result of these measures is that the mortuary rolls show the considerable increase of deaths registered of 6·71 per 1,000 of population, the total deaths recorded being 25·57 per 1,000. Although this ratio is higher than was ever before attained, it is still below that expected in so unhealthy a district as Rungpore.

Bogra.—Here quarterly statements, indicating the defects in registration in the registering circles, were sent by the Civil surgeon to the District Superintendent of Police, who adopted the required corrective steps.

Darjiling.—The Deputy Commissioner reports that since the introduction of the Compulsory Registration Act considerable improvement in registration has been effected in tea-gardens, the deaths being more punctually reported. Some omissions were detected, but the recusants were not prosecuted, as they amply apologised and promised reform. The result of the measure was that the death-rolls showed an increase in the ratio of deaths registered of 5·19 per 1,000 of population; but owing to poor returns from those parts of the district in which the Compulsory Law is not in operation, comprising four-fifths of the district, the general result could not advance further than 17·99 per 1,000—a ratio which is very defective, considering that a large portion of Darjiling is Terai country were malaria is rife.

Patna.—A very good plan of testing registration was adopted in this district. The deaths reported from each group of villages forming a chowkidari

circle were separately recorded in the registers, and this record was from time to time checked by the superior Police Officers when on tour, special enquiries being made in those circles from which abnormally few deaths were reported.

Mozufferpore.—At Sitamurhi town a special peon has been employed to collect and report births and deaths to the Bukshi who has been appointed Registrar.

Bhagulpore.—In the Bhagulpore town the Civil Surgeon's clerk, and in the Colgong town a specially entertained man, register the deaths and verify the returns received weekly from the Police; and in the latter town the Municipal Commissioners have, under a resolution in meeting, consented to supervise systematically the registration in their respective wards, and to report the result to the Chairman.

Hazaribagh.—Here the Sub-inspectors and Head-constables have been made to submit weekly diaries exhibiting the names of the villages in which inquiries regarding the occurrence of deaths had been instituted by them. This is a good plan.

Measures adopted in this Office to improve Registration.

9. The information under this head is precisely the same as that detailed in the Annual Report of this Department for 1884—*vide* paragraph 5 and clauses 1, 2, 3, and 4 thereof—and need not therefore be reproduced in this Report. I have only to mention that I have reason to believe that the measures in question have worked satisfactorily.

Prospects of improvement in Registration.

10. It is true that appreciable advances in registration have been made during recent years, but it is equally true that there is yet very considerable room for further improvement; for a record, indicating that, on the whole, deaths were registered at the rate of 23 per 1,000 of population, cannot, independent of the many individual defects already pointed out, be accepted as even an approximately correct one for Bengal. The low standard of registration in Bengal is prominently exposed when compared with the returns* of some of the other Provinces in India. Nevertheless, the improvement which has already been steadily achieved year by year affords the hope that accuracy will be ultimately attained. This highly desirable end will be greatly facilitated when the Village Watchman's Act (now under consideration by the Bengal Legislative Council) becomes law and is brought into operation. Under its provisions the registration of births and deaths in all villages, excepting those in Chota Nagpore and the Sonthal Pergunnahs, has been made compulsory, as every householder is bound under penalty to report the events to some member of the Punchayet appointed in his village; then every Punchayet is bound, also under penalty, to register the events and to transmit the contents of his register, through the village watchman, to the officer in charge of the police-station in which the village is situated, the village watchman being also punishable if he omits to deliver at the police-station the record of the events given to him by the Punchayet. If these agencies are properly utilised, a complete organisation for the collection of the statistics will be provided for the Province. I have already shown in my Report for 1884 how the District and Local Boards and the Union Committees, shortly to be appointed under the Local Self-Government Act of 1885, can, by means of their position and the influence they can bring to bear on the people, co-operate in promoting the registration of births and deaths. In addition to the great assistance they can themselves render in this direction, they will possess, in the Village Watchman's Act above alluded to, the required machinery for carrying out the work systematically and efficiently. It is to be hoped that they will use every endeavour to render registration complete and accurate.

Extension of the Compulsory Registration Act IV (B.C.) of 1873.

11. This law was extended during the year under review to the Chatra Municipality in Hazaribagh. This brings up the number of localities in which it is in operation to 117 towns and one rural area in Darjiling. Prosecutions for breaches of the

provisions of this enactment were instituted in the Municipalities named in the subjoined table, with the results therein indicated—

Districts.	Towns.	Number prosecuted.	Number convicted.	Number acquitted.	Number struck off.	Number pending.	Amount of fines realised.	Ratio per 1,000 of Population.

	Total ..	481	298	57	121	5	201 15 6		

The results above tabulated, compared with those in the similar table of 1884, show that 481 against 396 persons were prosecuted in 48 against 42 towns; that, of this number, 298, or 62 per cent., against 316, or 79 per cent., were convicted; and that the fines imposed on, and realized from the recusants amounted to Rs. 202 against Rs. 240. This comparison indicates a small but not satisfactory improvement, particularly as in the great majority of the towns a smaller number of births than deaths were registered. It is noticeable that of 119 cases brought up in the Bhagulpore town no less than 110 were struck off the file, showing great want of judgment on the part of the prosecution.

Changes affecting Circles of Registration.

12. The principal revisions under this head consisted of interchanges of villages between thanas, removals of villages from one district or thana to another, transfers of head-quarters, amalgamation of towns or unions with thanas, creation of new municipalities, &c. These changes, however, did not affect the total population under registration in the Province.

BIRTH STATISTICS.

Number born.

13. The number born during the year under review in the 46 towns under registration amounted, eliminating 1,287 still-births, to 41,133, or at 24·71 per 1,000 of population numbering 1,664,577, against 39,640 births, or at 23·51 per 1,000 in the preceding year. The birth-rate contrasted with the death-rate in the same area, which amounts to 31·70 per 1,000, shows that the latter was not even overtaken by the former, but that, on the contrary, there was an excess of deaths over births to the extent of 11,640, or in the proportion of 6·99 per 1,000.

14. The following towns returned the highest proportions of births :—

	Ratio per mille.		Ratio per mille.
*Jamalpore in Monghyr	53·23	*Sitamurhi	34·44
*Bhagulpore	40·41	*Gya	34·11
*Bettiah	38·28	Patna	32·93
*Brahmanberiah	37·84	Durbhanga	32·42
*Revilgunj	37·30	Comillah	29·54
Shaikpura	36·03	*Jamalpore in Mymensing ...	29·33
*Kendrapara	34·97		

The towns distinguished by asterisks have returned good results during the past three to five years.

15. While, on the whole, as above stated, the deaths exceeded the births, the following Municipalities formed exceptions to the rule :—

Towns which recorded Births in excess of Deaths.

	Rate of excess per 1,000 of population.		Rate of excess per 1,000 of population.
*Brahmanberiah...	12·08	*Bankura	2·66
*Comillah	8·89	*Mokamah	2·40
*Kendrapara	7·33	*Jamalpore in Mymensing ...	1·91
Bishenpur	4·08	*Bettiah	·52
		*Behar	·45

In the Municipalities distinguished by asterisks births exceeded deaths during the past three to five years.

16. Of the aggregate number of children born, 21,933 were boys and 19,200 girls, yielding the proportionate ratios to population of 13·17 and 11·53 per 1,000, respectively, against 12·65 and 10·86 per 1,000 in the preceding year. The percentage of male to female births was 114 against 116. These figures indicate that both the male and female birth-rates were in excess of those of the preceding year, and that, as usual in Bengal, more boys were born than girls.

Births according to Sex.

17. The table in the margin exhibits the events distributed into the classes or nationalities among whom they occurred. The figures indicate that relatively, with reference to the populations of the respective communities, the birth-rate was highest among the Christians, and in the next degree and nearly in equal ratio, among the Hindus and Mahomedans, eliminating the other denominations.

Births according to Class or Nationality.

	Deaths.	Ratio per mille.
Christians	497	28·17
Hindus . ..	29,168	24·96
Mahomedans	11,453	24·24
Budhists	28	13·23
Other classes	87	21·79

18. Under this head 432 births, divided into 228 males and 204 females, were recorded during the first three quarters of the year. The returns of the fourth quarter have not been received.

Births among Non-Asiatics and Mixed Races.

DEATH STATISTICS.

19. The mortuary statistics of the year were registered among a population numbering 66,163,884, of whom 2,277,055 belong to the urban circles and 63,886,829 to the rural, and were recorded in 647 (94 urban and 553 rural) main registering circles. The distribution of the population according to sex and nationality is detailed in the margin.

Population and Area under Registration.

According to Sex.	
Males ...	32,832,216
Females ...	33,331,668

According to Class or Nationality.	
Christians ...	101,884
Hindus ...	42,953,029
Mahomedans ...	21,361,957
Budhists ...	79,721
Other classes ...	1,667,293

20. Excluding 21,111 who were born dead, 1,504,745 persons were reported to have died from diseases during the year under notice from among the population mentioned in the above paragraph, being at the rate of 22·74 per 1,000 in opposition to 20·83 per 1,000 in the preceding year, indicating that the mortality had increased by 1·91 per 1,000.

Number and proportion of Deaths to Population.

21. To the mortality of the year the urban circles contributed 72,024 deaths, or in the proportion to population of 31·63 per 1,000, and the rural 1,432,721 deaths, or at 22·42 per 1,000. In 1884 there died in the urban circles 67,443 persons,

Comparative mortality in the Urban and Rural Circles.

or at 27·43 per 1,000, and in the rural 1,311,167, or at 20·58 per 1,000. A comparison of the casualties of the two years shows an enhancement of mortality during the year under notice in both circles, viz., of 4·20 per 1,000 in the former and 1·84 per 1,000 in the latter, indicating that, contrary to the experience of the last year, the urban circles were on the whole unhealthier than the rural.

22. *Mortality from Specific Death Causes.*

The above information is furnished in the marginal table, compared with the similar information of the preceding year and of the lustrum 1880-84. The figures in it indicate that, while there was a sensible reduction in the casualty rate from small-pox, the mortality from every other death-cause was higher in the Province, as well as in its urban and rural divisions, than during both the periods with which comparison is instituted, excepting that the fatal result from fever during the quinquennium 1880-84 was greater in the urban circles. It is also noticeable that, as in 1884, the rural circles suffered at a higher rate from fever than the urban.

	PROPORTION OF DEATHS PER 1,000 OF POPULATION.

23. *Mortality in Bengal, Behar, Orissa and Chota Nagpore.*

The mortality per mille of population from the principal death-causes in the four great divisions of the Province is marginally exhibited in the order of relative severity of each disease. The figures show that Orissa took the lead in mortality from cholera, small-pox and bowel-complaints, and Bengal from fever; and that the lowest death-rate from cholera was returned by Chota Nagpore, from small-pox and bowel-complaints by Bengal, and from fever by Orissa.

Chota Nagpore ...	11·77	Behar	·85
Orissa	6 72	Bengal	·78

24. The marginal figures, which illustrate the seasonal incidence of mortality from all diseases, again show that the fourth quarter of the year is the most fatal to life in the Province.

Seasonal incidence of the Diseases.

	Deaths in 1885.	Deaths in 1880-84.
First quarter	320,395	280,863
Second ,, ...	331,887	282,614
Third ,, ...	386,283	277,136
Fourth ,, ...	466,180	389,797

25. In the year under notice 24·65 per 1,000 of the male population and 20·86 per 1,000 of the female died, the proportion of male deaths to every 100 female deaths being 116. The corresponding figures of the preceding year are male deaths 22·81 per 1,000, female 18·88 per 1,000, and percentage of male to female deaths 119; and of the lustrum 1880-84, male deaths 20·50, female 16·71 per 1,000, and percentage of male to female deaths 120. The results disclose the same feature throughout from 1880 to 1885, viz., that the male deaths exceeded the female.

Mortality according to Sex.

26. Under this head the interesting point for consideration is the mortality among infants, children, and the aged, for the ages at death among these classes can be determined with greater exactness than those among the intermediate classes or adults, which are known to be returned with little precision, very few natives being acquainted with their real ages. Looking, then, into the

Mortality according to Age.

returns we find that the highest death-rates were reported to have occurred among infants, children, and the aged. The proportions are given in the margin, compared with the average figures of the three preceding years for which data are available. The higher ratios of 1885 are in a great measure associated with improving registration, but the record is yet defective.

	In 1885.	In 1882-84.
Under 1 year	118·94	102·33
1 to 5 years	25·02	21·63

60 years and above	55·55	46·23
Mean rate for adults	15·97	14·35

27. Marginally are shown the casualty rates among the different classes of the communities which compose the population under registration exhibited in paragraph 19, contrasted with similar data for the quinquennium immediately preceding. Of the three chief nationalities, the Christians on the whole suffered least during both periods, and the Hindus and Mahomedans almost equally in 1885, but not so during the lustrum above indicated, when the Mahomedans took precedence of the Hindus.

Mortality according to Class or Nationality.

	In 1885.	In 1880-84.
Christians	12·46	12·51
Hindus	23·09	18·36
Mahomedans	22·71	19·26
Budhists	15·05	6·10
Other classes	14·80	16·48

28. 495 deaths (males 340 and females 155) where reported from among these classes during the year, excluding the fourth quarter, for which no returns were received, and of them 56 died from cholera, 8 from small-pox, 88 from fever, 69 from bowel-complaints 32 from injury, and 242 from other causes.

Deaths of Non-Asiatics and Mixed Races.

29. *Births and deaths in Calcutta in* 1885 *compared with the same events in the Bengal Towns.*

The above information is tabulated in the margin. The figures presented in this table indicate that, on the whole, the Bengal towns excelled Calcutta both in birth and death registration; the casualty rates from cholera, bowel-complaints and fever being greater. But the higher mortality from the last named disease was, however, balanced by the large excess in Calcutta in death-rate from the maladies classed under the head of "other causes," due no doubt, to some extent, to Calcutta possessing better means of diagnosing disease than the Bengal towns, where many deaths attended with febrile symptoms are through ignorance recorded as having occurred from fever.

	Ratio of Births per 1,000 of Population.	Ratio of Deaths per 1,000 of Population from—

30. *Mortality of Natives in the* *9 *Cantonments in Bengal.*

In the Cantonments in Bengal, 727 natives died, being in the proportion of 21·49 per 1,000 of average population which amounted to 33,829, against 24·35 per 1,000 during the preceding year. The distribution of the gross mortality into its different causes stood as submitted in the margin in contrast with the results of the preceding year. The comparison indicates that the Cantonments enjoyed better health during the year under review, the casualties from every death cause, excepting injury, having diminished, small-pox showing no deaths. Darjiling suffered the most, Alipore the least, and the rest of the Cantonments intermediately, *vide* figures in the margin.

* There were 11 Cantonments in 1884, but troops ceased to occupy Hazaribagh and Segowli in 1885.

Port of Calcutta.—*Sickness and Mortality in—*.

31. During the year 1885 the number of ***European Seamen*** who entered the Port amounted to 23,573, of whom 21,449 were new arrivals, the daily average number present being 1,693. The admission into hospital for, and the casualty rates from, the different death causes which were in operation during the year under review among this class of seamen stood as indicated in the subjoined table, contrasted with the similar information for the preceding year:—

Among European Seamen.

Grand Total	1,976	52	2·02	30·71	2,026	107	3·75	63·53

The comparison instituted in the above table indicates—

(1) That of the total number of seamen, 1,976 were admitted into hospital for all diseases, and that of the admissions 40 died in hospital, representing a death-rate of 23·62 per 1,000 of average strength, as opposed to 2,026 admissions with 76 deaths, or at 45·13 per 1,000 during the preceding year; and that in addition there occurred out of hospital three deaths from diseases and 9 from drowning, thus raising the total death-rate to 30·71 per 1,000 against 63·53 per 1,000 in 1884.

(2) That the admissions into hospital for, and the mortality from, cholera were considerably less; that enteric fever displayed less severity; that for malarious fever the admissions were larger, but the death-rate was the same; that the admissions for sunstroke were less, but the mortality was greater; that both the admissions and casualty rate from dysentery were greater; that no mortality occurred from diarrhœa, simple fever, scurvy and small-pox, the admissions for these diseases being also smaller, excepting with regard to simple fever; and that both admissions and deaths from the maladies classed under the head "other diseases" had diminished.

Fuller particulars regarding the diseases above specified will be submitted in the subsequent sections of this Report which deal with the same diseases as they occurred in the Province at large; but it should be stated here that a review of the figures given in the foregoing table shows that, on the whole, the year under notice was an exceptionally favourable one for the European

	Admissions into hospital.	Ratio of deaths per 1,000 of population from—		
		Cholera.	Other diseases.	Total.
In 1885	1,167	4·1	19·4	23·6

seamen. Extending the comparison further, it is also seen that their health status was better than even during the five years preceding 1885, *vide* figures cited in the margin.

Deaths at Sea.

32. Forty-six deaths, against 37 in the preceding year, occurred at sea among European seamen. These casualties occurred, from drowning 19, falling from aloft, &c., 6, cholera 2, small-pox 1, heat apoplexy 2, heart-disease 5, and dropsy, dysentery, &c. (details not furnished) 11.

Native Floating Population.

33. One hundred and three deaths were reported to have occurred among the *Native Floating Population*, numbering 25,409, which represents a death-rate of 4·05 per 1,000, against 197 deaths, or at 7·75 per 1,000, during the preceding year. Details of this mortality, indicating the diseases which brought it about and the casualty rate from each death-cause, &c., are furnished in the margin. This record is on the face of it defective. Many deaths could not have been reported, and then there is the fact that the sick among the up-country boatmen invariably go to their homes if the nature of the disease they are labouring under admits of their getting away. The only approximately correct record are the figures representing the mortality from cholera and small-pox. With regard to these diseases, it will be seen that they were less fatal than in the preceding year, cholera considerably so.

Health and treatment of Lascar crews on foreign voyages.

34. 28,131 lascars arrived in the Port and 27,847 departed from it. The corresponding figures of the preceding year were 24,962 and 25,253 respectively, indicating an increase in both arrivals and departures. There occurred 43 deaths during the voyage among this class of seamen, which, calculated on the average population afloat—10,003—gives a death-rate of 4·28 per 1,000 against 27 deaths, or at 2·94 per 1,000 in 1884, showing that the mortality was much greater. It appears that, with one exception, the treatment of these men during the voyage was good. The complaint in this case was that they had received no lime-juice at sea. This complaint having been substantiated at the Shipping Office, compensation was granted.

35. The reports demonstrate that of the 45 districts in the Province 24 enjoyed fairly good health, due chiefly to absence of epidemic prevalence of disease, and that the 21 named in the margin were markedly unhealthy, the causes of insalubrity being excessively fatal prevalence of cholera, or fever, or both, and in some cases of bowel-complaints. Some of the local officers, while admitting that the year was an unhealthy one for their districts, ascribe the numerical increase in the number of deaths partly to improved registration; and again others, such as those of Julpaiguri, Darjiling and Lohardugga, refer the entire increase to the same cause. The Deputy Commissioner of Darjiling is of opinion that the year, which was distinguished for abnormally heavy rainfall, was the healthiest year known in his district for over a decade. The Deputy Commissioner of Julpaiguri says that the clearance of jungle for the establishment of tea-gardens and improved cultivation, and consequently general prosperity, have tended to improve the sanitary condition of the district. The Duars are distinctly more healthy than they were some years ago. On the other hand, the tea districts are attracting people not only to Julpaiguri, but also to

Dam-Dim and other places, where markets have been established and bazars are springing up, which are likely to call for some measures in the interests of sanitation ere long. The Magistrate of Balasore ascribes the very great improvement in health which has occurred, to the increased prosperity of the people from a long succession of good harvests and high prices. The people are known to be improving their houses and buying extra furniture and better food; and this superior style of living may have influenced health beneficially.

36. There was some cause for complaint with regard to the agricultural outturn of the year, so far as the staple articles of diet on which the people subsist are concerned. The table in the margin exhibits the prices which prevailed during the year for these articles. It will be seen that, on the whole, while the cost for wheat had diminished, the prices for the other articles were higher, particularly for rice. Examined in detail, the harvest of the year is found to have been good in 5 districts, above average in 13, and equal to average in 10; but below average in 16. The deterioration in these 16 districts was due to the usual fluctuation associated with rainfall and to heavy inundations, which formed a characteristic feature of this year in a great portion of the Province, of the direct effects of which on public health I shall presently speak. In the districts on the marginal list in the immediately preceding paragraph, which are distinguished by asterisks, the impairment of health is reported to have been brought about to some extent by distress caused by high prices for food-grains. Other districts also, viz. Burdwan, Midnapore, Jessore, Murshidabad, Rajshahye, Faridpur, and Maldah suffered similarly from the same cause. As usual, the distress prevailed most among the labouring classes, the poor agriculturists, the aged, diseased, and feeble, and among women with children, who were widowed or whose husbands had left them to seek employment elsewhere. In some districts, such as Burdwan, Midnapore, Murshidabad, Gya, Cuttack and Balasore, gratuitous aid had to be given to those who could not work and relief works had to be improvised for the able-bodied, and loans under the Agriculturists Loans Act had to be advanced to agriculturists. Notices of a few prominent instances of the prevalent distress will not be out of place here. In parts of Rajshahye the poorer class had to live on unwholesome vegetables, which is said to have caused cholera and much sickness. The Civil Surgeon of Bogra attributes the high mortality which prevailed in the district to scarcity of food-grains. In many places in Faridpur, fever and sporadic cases of cholera were said to have occurred from the same cause. Many stragglers appear to have come into the town of Gya to die, having been driven from their homes by want. The Magistrate of Durbhanga thinks that the high mortality of the year—the highest on record during the past five years—was in part due to the bad and insufficient food with which the lower classes were compelled to be contented. The Civil Surgeon of the Sonthal Pergunnahs reports that the dearness of food-grains must have to some extent lowered the stamina of the labouring and poorer classes, and rendered them more liable to climatic influences and fatal diseases. On the other hand, the Magistrate of Shahabad notes, "there is a common belief that when prices fall the public health deteriorates, and the year under notice was an illustration of it."

Agricultural out-turn.

37. The inundations caused by the abnormal rainfall of the year were unusually extensive. While, on the one hand, they proved a calamity by destroying and damaging the agricultural outturn wholly or partially, and by causing heavy loss of cattle, they exercised, on the other hand, a great power for good by diminishing sickness in the great majority of the localities in which they prevailed. Of this I was persuaded during my winter tour in Murshidabad, Burdwan, Maldah and Purneah, and there is a concensus of opinion

Inundations.

that fever and bowel-complaints had been greatly reduced by them. A few of the local officers are, however, of a contrary opinion, particularly with regard to fever. The explanation accounting for the reduction of sickness in association with inundations is simple and natural. The inundations replenished the tanks which, when the sediment had subsided, afforded a supply of good and wholesome drinking water; filled bheels and old river beds with a fresh supply of water in the place of an impure stagnant one; swept through villages, carrying off accumulated filth; and deposited a fertilizing silt on the fields.

It would be travelling out of the limits of my Report to furnish the full history of the inundations in the districts. I will therefore confine myself to notices of the most marked instances of improvement or deterioration in health generally traceable to them, and in the sections of my Report devoted to the histories of cholera and fever will be found accounts of the direct effects they had on the prevalence and fatality of these diseases. The sub-divisional officer of Ranaghât in *Nuddea* reports that the bhils in the north of his sub-division, which originally formed the beds of the Hangore, Jamuna, Gomati, and other streams which intersect the sub-division, and which had in course of time silted up, were washed out, with the advantage that their water is now potable and has met a crying want of the sub-division. Moreover, the impurities having been swept off, there is less chance of future sickness. The observations of Dr. ffrench-Mullen, Offg. Deputy Sanitary Commissioner, Metropolitan Circles, go to show that in some villages visited by him in thanas Meherpore, Hanskhali and Santipore, in this district, there was no fever or cholera, and in some very little of them; that the general health was good, scores of adults and children who came around him looking comfortable and well fed, although they pleaded poverty and said that they had been reduced to one meal a day owing to the scarcity. In one village—Hanskhali—the people were gradually dying off, from debility caused by the severe wave of fever which passed over the village in 1884; but here even the general health had improved, and there was no cholera. The mortality among the cattle was, however, very great, due to *basunti*, or swelled necks, caused by eating grass which had been submerged and become half rotten. In the sub-divisions of Bongong, Magurah, and Jhenidah in *Jessore*, no disease could be traced to the floods, and Dr. Mullen, who visited some of the villages in thana Bongong, confirms this opinion, except that in village Srimuntapore there was much chronic fever. The Medical officer of *Maldah* reports that the effect of the flooding was salutary; cholera and fever, which generally appear with great severity in the cold weather, were much less this season, and the towns of English Bazar and old Maldah enjoyed great immunity from the latter disease. On the other hand, the Assistant Surgeon of *Faridpur* attributes the high death-rate in the district from fever during November and December to the inundations. In *Shahabad*, where the inundations were very extensive, the Civil Surgeon has no doubt that the great prevalence of malarial fever was due to them. The Civil Surgeon of *Mozufferpore* observes that, as in previous years, he failed to trace any marked connection between inundations and outbreaks of malarious disease. The Civil Surgeon of *Chumparun* states that it is not proved that the greater mortality of the year from cholera or fever was due to the inundations, that the towns of Bettiah and Motihari, where the diseases were most prevalent, were not inundated; but that it should be remembered that the rise of the river caused a corresponding rise in subsoil water. In *Bhagulpore* it was observed that during July, August and September, when there were considerable floods, fever and cholera prevailed. The sub divisional officer of Pakour in the *Sonthal Pergunnahs* remarks that during the floods no bad effect on health was perceptible, but that when the water began to subside, fevers commenced to increase. The Civil Surgeon of *Poori* reports that the apparent effect of the inundation was that fever increased in November and December; but it is to be observed that the inundation occurred in June.

Though the opinions given are somewhat contradictory, and some are given after insufficient opportunity for inquiry, still I think it may be accepted that in the districts of Lower Bengal floods from the Ganges andi ts offshoots are beneficial, while, as to their effects in the districts in Behar, more observations are required.

38. The cyclonic gale and storm-wave, which occurred in Cuttack, appear to have, in addition to their fearful immediate effects, which will be presently referred to, involved, according to the Civil Surgeon, in their train much suffering from fever and cholera generally in the affected localities, and severe fever and dysentery in thanas Kendrapara, Aul, and Patamundi, referable to exposure and hardship, and chiefly to the water-supply having not only been rendered brackish for the time, but also contaminated by the bodies of the drowned, by fallen trees, and by other causes of impurity. The Deputy Sanitary Commissioner, Orissa Circle, notes that there was much cholera in the Kendrapara sub-division, traceable to the effects of the storm-wave. But the mortuary records do not support the above assertions, for there occurred 1,765 less deaths from cholera and 3,322 from fever during October, November and December, as compared with the mortality from these diseases during the period anterior to the occurrence of the storm-wave.

Cyclonic gale and storm-wave in Orissa.

This cyclonic storm occurred on the 22nd September. It moved on from False Point in a north-westerly direction across this district towards Balasore and Chota Nagpore, affecting chiefly thanas Aul, Patamundi, Kendrapara, Jajpore and Dharmsala. The flood-wave rose to a height of from 16 to 18 feet, carried away everything before it, and overwhelmed whole villages from which there were but few and miraculous escapes, and completely changed their aspect, so that they could hardly be recognised. It caused great loss of life among human beings and cattle. It is estimated that about 10,000 to 15,000 human lives were lost, and Mr. Naidu, the Deputy Sanitary Commissioner of the Orissa Circle, who visited the affected localities, states that in thanas Jajpore, Dharmsala, Kendrapara, Patamundi and Aul, 5,570 villages were affected, of which 186 were entirely swept away, and that 2,342 persons and 13,003 cattle were killed. The sea-shore was lined with bodies whitening on the sand, and many corpses and carcasses of animals were left in the creeks, rivers, tanks, fields, ditches, &c. Several vessels became total wrecks or were seriously damaged. Houses were unroofed, huts levelled, trees uprooted, and the country laid bare, particularly in thanas Jajpore and Dharmsala. All food-supply was destroyed, and, as above stated, the drinking water was polluted. Special Hospital Assistants were deputed to the affected localities, and medicines distributed through the Police. Supplies of food were sent to the afflicted, and sweepers were employed to bury the dead and remove carcasses of animals from the water-courses and other places.

In Balasore this storm-wave was not so severe in its ravages as in Cuttack, but it laid large tracts of country under water, and did considerable damage to cattle and crops. The consequent distress was so great as to necessitate the adoption of relief measures from the money that had been subscribed for the relief of the sufferers in Cuttack. It does not appear that this disaster carried in its wake any increase of sickness in this district.

39. It should be mentioned that earthquakes occurred in Dacca, Rajshahye, Bogra and Mymensing on the 14th July. In Bogra 84 deaths were recorded from this cause. In Mymensing the damage to property was very large. Many two-storied and one-storied houses collapsed, were damaged, or so shaken as to become unsafe. The injury to property in Nasirabad was estimated at between eight and nine lakhs of rupees. In Muktagachi one man was killed by the falling of a temple. In Jamalpur two persons met their death by the fall of a zemindar's kutchery. In Sherpur town in Bogra in many places long fissures occurred in the earth, from which sand and water issued, and a quantity of coal was ejected at Dhatna, 10 miles north-west of that town; one man was killed and several women were more or less severely injured.

Earthquakes in certain districts.

SECTION VI.

HISTORY OF THE CHIEF DISEASES.

CHOLERA.

40. Cholera prevailed with almost unprecedented severity during the year under review. The recorded deaths numbered 173,767, or at the rate of 2·62 per 1,000 of the population under registration—a mortality which, it will be seen from the marginal figures, was never reached during any year of the past decade, on the records of which any reliance can be placed, excepting in 1876 and 1882. The disease visited every district, attacked 29,239 of the villages against 24,621 in 1884, and prevailed with epidemic intensity in 101 of the registering circles against 90, with marked severity in 118 against 90, and with much immunity in 415 against 432; while only 13 circles against 37 altogether escaped the scourge.

Years.	*Deaths.*	*Ratio per mille.*	*Years.*	*Deaths.*	*Ratio per mille.*
1875	108,262	1·63	1880	39,643	·59
1876	196,590	2·97	1881	79,180	1·19
1877	155,305	2·34	1882	182,352	2·75
1878	95,192	1·43	1883	90,439	1·36
1879	136,363	2·06	1884	134,421	2·03

41. To the total mortality of the year, the urban circles contributed 11,907 deaths, or in the proportion to population of 5·22 per 1,000, and the rural 161,860 deaths, or at 2·53 per 1,000. The corresponding means of the quinquennium 1880-84 were—urban, 8,114 deaths, or at 3·32 per 1,000; rural 97,093 deaths, or at 1·52 per 1,000. The enhanced fatal results of the disease were greater in the urban than in the rural circles, but only to the extent of ·89 per 1,000 of population.

Comparative mortality from Cholera in Urban and Rural Areas.

42. Of the 45 districts in the Province, 18 against 11 in the preceding year exhibited lower death-rates from Cholera, and the greatest loss of life from this cause was reported to have occurred in the marginally-named 16 districts against 12 in 1884.

43. The noticeable features of the year under this head are:—After the scanty rainfall of January and February the mortality from Cholera suddenly rose very high in March. April and May followed the usual rule of being months in which the severity of the disease is very great. In June and July, months of heavy rainfall, the mortality subsided considerably as has been usually the case. August, usually a month of low mortality, exhibited, notwithstanding its great rainfall of 17·81 inches (the largest quantity of the year), the highest mortality. This was caused by the incidence of the disease in the Behar districts which are visited most severely in the rainy season. In August and during the early part of September heavy inundations occurred over a greater portion of the Province, and this contingency was followed by a steady reduction in cholera mortality during the months of September, October, November and December; and thus the winter prevalence of the disease, which is often the severest, was mitigated.

Seasonal prevalence of Cholera in Bengal, Behar, Orissa and Chota Nagpore.

44. *Bengal.*—There was an alteration in the normal incidence of Cholera in this Division of the Province taken as a whole. The severe phase of the disease commenced as usual in March, but instead of terminating in May, was protracted to June, and its winter prevalence was limited to January and December, the remaining months enjoying comparative immunity. The same features in the behaviour of the disease are observable in the Western, Central and Eastern districts of this Division, with the exception that the spring outbreak extended to September in the Western districts, and was limited to May (as usual) in the Eastern districts, and that the winter outbreak did not invade the Western districts excepting the districts of Midnapore and Howrah; but in these two, as also in the Central districts, the month of November also exhibited a high casualty rate.

Behar.—Here, on the whole, the severity of the disease began, as usual, to be felt in May and lasted up to November. In East Behar, however, it began one month earlier, *i.e.*, in April, and in West Behar one month later, *i.e.*, in June.

Orissa.—In this Division high death-rates from Cholera prevailed, as usual, throughout the year, but the months of greatest mortality were January and February, July and August, and November and December, the enhancement being no doubt influenced by mortality among pilgrims who passed through the Division during these months on their way to and from Puri or other shrines.

Chota Nagpore.—In this Division May to August were, as usual, the months of highest mortality; but in Hazaribagh the severity of the disease was prolonged up to November, and in Manbhum it was limited to July. Lohardugga exhibited exceptional casualty rates in August, September and October, and Singbhum only in April.

Prevalence of Cholera as delineated by the Cholera Map.

45. The map illustrating the distribution of Cholera in Bengal during the year under review, which is appended to this Report, indicates that while, on the one hand, the districts of Darjiling, Julpaiguri, Lohardugga, Singbhum, and Noakhalli excepting its Fenny sub-division, and the sub-divisions of Midnapore, of Gaibanda and Karigram in Rungpore, of Manickgunge in Dacca, of Dum-Dum in the 24-Pergunnahs, of Tajpur in Darbhanga, of Barrh and Behar in Patna, and of Aurungabad and Jehanabad in Gya, were comparatively very free from Cholera, exhibiting death-rates below 10 per 10,000 of population, on the other hand, in the undermentioned sub-divisions the suffering was very great, the death-rates in them ranging from 30 to 96 per 10,000 of population against 32 to 92 per 10,000 in 1884:—

Cholera at Fairs.

46. From the subjoined table it will be seen that more Cholera prevailed at the Fairs than last year, and that the list is a longer one. It was, however, naturally to be expected that in a year when the disease was so diffusely spread over the Province, public gatherings could not escape. Moreover, it will be seen that at some of the Fairs, especially in Cuttack, want of precautions no doubt favoured the outbreaks, and I very much doubt whether the sanitary arrangements made at other Fairs—the Barooni Fair in Dacca,

and the assemblage of pilgrims in Puri excepted—were all that are desirable:—

Districts.	Where held.	Name of Fair.	When held.	Duration of Fair.	Number present.	Cholera Cases and Deaths.		Were sanitary precautions adopted?

The following causes were reported to have occasioned some of the outbreaks of cholera tabulated above. At the fairs in *Hughli* it was ascribed to excessive heat. At the Chooramani fair in the 24-*Pergunnahs* the gathering consisted of pilgrims who were crowded to suffocation within the limited number of huts and lodging-houses which were available. On the occurrence of the outbreak all sanitary precautions were taken and medical assistance rendered, but these being insufficient to arrest the spread of the disease, the pilgrims dispersed. Steps have been taken to prevent future overcrowding. At the Ruthjatra in *Murshidabad* the outbreak was severe, and occurred among pilgrims who came mostly from the Eastern districts. All needful steps were taken for the care of the sick and the arrest of the disease. At the Mongalbund fair in *Dacca* the sanitary arrangements were bad with regard to conservancy. The places at which the two fairs—Barihazari and Ramkilla—in *Maldah* are held are situated close to vast jungles, and the water-supply was scanty and bad. At the former the jungle is denser, the soil higher and drier, and the difficulty about water greater. At Ramkilla medical assistance was rendered on the occurrence of the outbreak, and since then steps have been taken to put the tanks in order and to set apart one of them for drinking-water only. At the Barihazari fair the physical difficulties of the place are too great to allow of an expectation of preventing outbreaks of disease from time to time, especially in the dry season. The outbreak at the Madhubun fair in *Hazaribagh*, at the foot of Parisnath, is reported to have been severe in character, but the numbers of cases and casualties have not been furnished. It occurred, however, among pilgrims, a large concourse of whom had assembled, as this was the 12th anniversary of the fair, and a specially large assembly was expected. Nevertheless, no sanitary arrangements were made, and to this omission the outbreak is attributed. At the Ruthjatra or Car festival held in *Puri*, the provisions of the Puri Lodging-house Act were carefully and strictly enforced; extra establishment was entertained to attend to the conservancy and latrine arrangements; and medical assistance and medicines were provided on the road from Cuttack to Puri for the cholera-affected pilgrims. No special measures beyond those usually adopted were deemed necessary at the Panchak festival. At *Cuttack* the pilgrims were as usual attacked with cholera when they passed through the district on their way to Puri to attend the Ruthjatra. No sanitary precautions were adopted, except that the sick found near the town were taken to the Cuttack General Hospital and some to the Dharmsala Dispensary.

Incidence of Cholera in the Districts.

47. The statistical information illustrating the prevalence and fatality of Cholera in the Districts during the year under review, and the leading facts connected with its incidence, are subjoined.

BENGAL.

48. In *Bengal Proper* the prevalence and fatality of Cholera had, on the whole, diminished somewhat in 1885 in comparison with its incidence during the preceding year. Its statistics denote that the disease pervaded 12·97 per cent. of its villages, and carried off 82,382 of its population numbering 35,073,770, or at the rate of 2·34 per 1,000, as opposed to 2·71 per 1,000 in 1884. The death-rate of the quinquennium 1880-84 was, however, lower, viz., 1·76 per 1,000. Next to Chota Nagpore, this Division of the Province suffered the least from Cholera this year.

Cholera prevalence in the Bengal Division of the Province.

49. In the marginal table are presented the Cholera statistics of the several districts comprising the Burdwan Division. They indicate, (1) that in comparison with the figures of the preceding year, Cholera invaded larger areas in the Burdwan, Bankura and Birbhum, districts, notably in Birbhum, and smaller ones in Midnapore, Hughli and Howrah; (2) that while Burdwan and Howrah presented noticeably high death-rates, and Bankura, Midnapore and Hughli normal ones, the mortality was highest in the Birbhum district; and (3) that enhanced fatal results occurred in the Birbhum Burdwan, Bankura and Hughli districts, in the order named, in comparision with the outcomes of both 1884 and the quinquennium 1880-84. In seasonal incidence of the disease, while in Midnapore, Hughli and Howrah the suffering was greatest during the earlier months of the year, in the other districts it commenced in March, but lingered on much beyond June, the month of cessation of high suffering. It is, moreover, remarkable that the winter prevalence of the disease was unusually mild. The months of heaviest rainfall were June to September in all the districts.

50. *Burdwan.*—There was considerable increase of Cholera in this district during the year, and the mortality was severe, amounting to 3·86 per 1,000 of population. Moreover, the Civil Surgeon is of opinion that prolonged cases of Cholera were frequently recorded under the head of bowel-complaints. The disease is said to have prevailed epidemically in May and June throughout the district. Every circle, excepting Selimabad, suffered severely, those named in the margin conspicuously so. Severe outbreaks occurred in certain parts of thanas Ranigunge (3·50 per 1,000), Assensole (4·48 per 1,000), Kaksa (4·69 per 1,000), and in the villages where the mines of the Bengal and Equitable Coal Companies are situated. They have again been associated with pilgrims, and, in some of these places, with bad drinking water. At Lodma and Bogunia, two villages close to the Barakur Railway station, 43 pilgrims are said to have died. I visited these villages and found them crowded with coal carters much more than with pilgrims. The very high mortality in the Culna town is attributed to its objectionable conservancy arrangements, the existence of well-privies being the chief evil. No accounts have been furnished regarding the other areas of high mortality named above.

Sonamukhi thana ...	3·39	Indas „ ...	1·92
Gungajulghati „ ...	2·93		

suffering was great. In thanas Gungajulghati, Sonamukhi, Bishenpur and Indas, which are situated in the northern and eastern parts of the district, the insanitary conditions are, it is said, the worst imaginable. They are ill-drained with marshy land, and cess-pools with accumulations of filth, and low jungle abound. The habits of the people are very filthy, and heaping of cowdung near houses is the rule. In connection with the outbreaks in these thanas, the Assistant Surgeon in medical charge of the district has, I think, conclusively shown that the incidence of the disease is not referable to pilgrimage. The observed facts were, that of the four affected thanas, Gungajulghati and Bishenpur are situated on the pilgrim route, while the other two are far removed from intercourse with pilgrims; that even in the two former thanas the greater number of the deaths occurred in places situated in the interior; and that while the most celebrated of the festivals which attract pilgrims proceeding in large numbers to Puri, is the Ruthjattra, which, owing to its having commenced this year on the 14th July and terminated on the 1st of August rendered it necessary for pilgrims to pass through Bankura during June and July and to return during August and September, Cholera prevailed in it most severely in April and May, or during a period anterior to the pilgrimage months. The view of the question entertained in Burdwan is quite opposed to that expressed here. With regard to the state of Gungajulghati, Assistant Surgeon Ashutosh Law, Deputy Superintendent of Vaccination, Metropolitan Circles, supports the opinion of the local authorities; for he found its villages to be in an extremely filthy and insanitary condition. In an outbreak of Cholera in the Bankura town commencing in July and ending in September, the following observations, worthy of notice, were made by the Assistant Surgeon, *viz.*, that the disease was mild in character and confined to individual cases only, although there was a continuous influx of pilgrims going to Puri in July; that a number of cases occurred after the first heavy showers of rain in July; that the cases occurred simultaneously in the most crowded parts of the town, but far removed from intercommunication with the pilgrim route, which is outside the town; and that many cases of diarrhœa and dysentery prevailed at the same time when Cholera was present This outbreak was attributed to the people drinking the water of tanks which had been extremely polluted by the washings into them, by the first showers of rain, of organic matter and fœces from their banks.

52. *Birbhum.*—This district heads the list of cholera stricken districts this year. Twenty per cent. of its villages were pervaded by the disease and the mortality stood at 6·87 per 1,000 of population as opposed to only 1·46 per 1,000 in 1884, and was higher than during any of the past 10 years, the mean death-rate of the decade being 1·57 per 1,000. All the circles in the district suffered very severely, as will be seen from the marginal figures. There was a change in the seasonal incidence of the disease, for, contrary to the experience of former years when Cholera is at its minimum in July and August and all but ceases in September or October to be active again after that, this year commencing in March it was persistently fatal up to October, after which its severity rapidly declined. The history of Cholera in this district for the year under review brings out certain facts worthy of special consideration. Of local outbreaks the one which occurred in the Soori town was the severest. It is said that so severe and protracted an outbreak was not witnessed in this town within the last eight years. The first case was reported on the 2nd June as having occurred among some Bouries who had returned from the neighbouring village of Kuddea where Cholera was present. The disease reached its height in July, declined through August, and died out in the middle of September during the incessant drenching rain of that month, the rainfall of June, July and August amounting altogether to 33·42 inches, while that of September alone was 16·77 inches. Dr. Roy, the Civil Surgeon, endeavours to show that the disease had been imported and that it spread by intercommunication, but I refrain from submitting his observations, especially as the disease existed in several parts of the district at the same time. But a singular fact referred to by him is that of the friends and relatives of the Bouries, who lived in another quarter of the town

called Bouripara, but who attended upon their sick and helped to remove their dead, two fell victims to the disease, which then attacked several people in Bouripara. It was noticed that wherever the disease appeared it confined itself to a few houses; that while the central part of the town formed the area of visitation, the outskirts, the people of which had no occasion to go to the town for their water-supply, but derived it from independent sources, were entirely free from it; and that the jail, situated close to the affected localities, also enjoyed complete immunity from it. It appears to me that nothing can illustrate better the sanitary condition of a place than the severity of Cholera during an epidemic visitation. Had the Soori town been in a good sanitary state, which it is not, no such heavy mortality would have occurred in it. Mr. Warde-Jones, the Sub-divisional Officer of Ramporehat, again took the precautionary measures for suppressing the outbreak of Cholera in his sub-division and to prevent its assuming an epidemic form, which were narrated in my Report for 1884. His endeavours were apparently attended with some success, for while in his Sub-division the mortality amounted to 5·33 per 1,000 of population in the other Sub-division of the district it was 7·86 per 1,000. The unprecedented outbreak of Cholera in the district is ascribed by the Magistrate to an unusually severe and prolonged drought, as he does not think that it was more especially due to want of village sanitation. Adverting to the drought, the Civil Surgeon notes that the water famine seemed to him to be greater than the rice famine, for he saw in Nulhatti the very puddle on the roadside strained and the water thus obtained used by the people. He adds that "this water famine afterwards became general, and water began to be sold in villages as a rare commodity, and that never within the memory of the living generation was such a season of dryness observed before."

53. *Midnapore.*—There was less Cholera in this district, and the mortality, amounting to 1·43 per 1,000, was not excessive and is less than that of the last three years during which the disease had been gaining ascendancy in this district, and in only six* of its 29 circles the suffering was severe. The prevalence of Cholera in Pataspore was attributed to great want of good drinking-water, which was also felt in many other places. On the outbreak of the disease in the Midnapore town, the pilgrims coming from the Ranigunge and Burdwan routes were made to travel clear of the town, and Dr. Peck, the Civil Surgeon, took the precautionary measures of closing against use foul tanks, cleaning drains, fumigating dirty and ill- ventilated houses to leeward of the wave of the disease, to arrest its progress. They appeared to be successful in rendering abortive an outbreak which threatened seriously to invade the town. Dr. Peck observes that on every occasion when he visited cholera-stricken localities, he found that his orders to close foul tanks in their vicinity against use was followed by a complete subsidence of the disease. The same officer quotes the following instances of the behaviour of the disease to illustrate his belief that it does not follow the chief lines of intercourse. Thanah Salbuni, which is situated directly on each side of the pilgrim road which is traversed by streams of pilgrims who sleep there, had only 11 cases of Cholera, or at ·20 per 1,000 of population; while in Midnapore, to the south of the road, the death-rate amounted to one per 1,000. Again, the towns of Chundrakona and Khirpai, both situated on the main road between Ghatal and Gurbetta, almost entirely escaped, Chundrakona, which is a large straggling town situated at a point where the roads from Ghattal, Ramjibunpore, Gurbetta and Keshpur converge, notably so, for while a large number of deaths occurred in all these towns, Chundrakona escaped with only eight casualties.

54. *Hughli.*—The mortality from Cholera in this district amounted to 1·71 per 1,000 of population, indicating that, on the whole, the prevalence of the disease was not very severe. Nevertheless, the areas marginally cited furnished high death-rates. It will be noticed that the towns in this district figure

largely in this marginal list. I find from the local reports that the proposition to provide these riparian towns with a filtered water-supply has been rejected by a large majority of the Municipal Commissioners of Serampore as an unnecessary expense. The absolute necessity of a good water-supply for these towns has been fully shown in my Annual Report for 1883, paragraph 211, and I also exhibited in it how very severely they suffered from Cholera for a series of years owing to this want. The statistics of 1884 and 1885 indicate that these towns continued to furnish high death-rates. I hope the Government will take this question into serious consideration, and press the measure on the objectors.

55. *Howrah.*—In this district, while the disease was not very wide-spread, it caused a high mortality, *viz.*, 2·16 per 1,000 of population. The overcrowded towns of Balli and Howrah and thana Shampur suffered in the greatest degree, the death-rates in them amounting to 4·31, 4·09, and 4·00 per 1,000 of population, respectively. The disease prevailed most severely in April and May, subsided suddenly and markedly after the rains commenced, and increased again in November. Howrah has furnished no further account of its Cholera, but here the necessity of a good water-supply is evident.

56. The Cholera statistics of this Division of Bengal are furnished in the margin. They indicate a reduction in both the prevalence and fatality of the disease in every district composing it; but, on the whole, it suffered more severely than all the other divisions in Bengal. January to May and December were the months of greatest prevalence of the disease in all the districts excepting Murshidabad, where the suffering commenced later and was prolonged into July. The months of heaviest rainfall were June to September, but in Nuddea the rains were prolonged into October.

57. 24-*Pergunnahs*.—The mortality from Cholera in this district amounted to 3·07 per 1,000 of its population. While present in every circle, it displayed greatest activity in those named in the margin. The mortality in the Naihatti town, which heads this list, was contributed to, to a great extent, by an outbreak of the disease which occurred in the villages near the Gouripore mills, the deaths at one place near the Garipadigi village amounting to 20 from as many cooly huts. It is believed that the stagnant water of the village tank, which was freely used by the coolies, caused the outbreak, for on the use of this tank being prevented and copious sulphur fumigation being resorted to, the "disease disappeared almost immediately." The cooly huts are, moreover, ill-constructed, limited in accommodation, and have no ventilation, and their floors are almost on a level with the ground. The Suburbs of Calcutta continued to maintain the high mortality which has obtained in it for years. I visited this important Municipality in November and December, and found its several wards in much the same state as they were before, very few of the many suggestions for their improvement having been attended to. On page xlii of Appendix IV to this Report, a description of their present condition and a note of the very many defects calling for urgent rectification have been furnished. The Chairman of this Municipality attributes the insalubrity of the Entally ward to the drainage of Calcutta conveying an immense quantity of sewage to the Salt Water Lakes in its vicinity, and to thousands of waggons' load of sweepings, house-refuse, garbage, &c., being carried there for their reclamation. I consider his reasoning to be speculative,

	Ratio per *mille*.		Ratio per *mille*.

for the conveyance of sewage to, and the reclamation of the Lakes are still going on, and their evil results must have become more and more intensified year by year, and rendered Entally correspondingly more unhealthy; but the mortality in this ward has, according to the Vice-Chairman's showing, come down gradually from 3,664 deaths in 1877-78 (the year the above scheme commenced to 1,624 in 1884-85; thus showing that its health status has been improving. That the death-rate is yet high (amounting to 60·30 per 1,000 of population in 1884-85) is indicative of there being many inherent insanitary conditions in Entally requiring to be contended with before the Calcutta Corporation can be blamed. It is remarkable that while there was comparatively less Cholera in the Suburban Municipality, it prevailed with greater intensity in the Alipore Jail.

58. *Nuddea.*—There was a considerable reduction of mortality from Cholera in this district, *viz.*, of 1·54 per 1,000 of population, but the total death-rate, amounting to 4·25 per 1,000, is much higher than those of the other districts in the Presidency Division; and no less than 20* of its 31 circles exhibited high mortality. The disease passed on from the last to the present year, gradually increased through January and February,

rose to epidemic intensity in March and April, began to subside in May when some heavy showers of rain fell, and dwindled to insignificance during the unusually heavy rainfall of June to September, but again became severe during November and December. The March outbreak of the disease in the Nobodip town occurred chiefly among the pilgrims who came to the shrines there. The insanitary conditions prevalent in this town were described in my Report for 1884, but latrines have since been provided to prevent the pilgrims defiling the chur between the river and the town. In the Kishnaghur town a severe outbreak occurred, commencing on the 26th March and lasting till the end of April, in a part of it called Ghurni, chiefly inhabited by Moochis and poor Mahomedans. It was observed that none of the other inmates, six in number, of the house in which the first case occurred were attacked, but that the disease passed on to the immediately neighbouring house. Kishnaghur is a very large straggling town which, it is said, is being gradually depopulated by the prevalence of sickness in it. It is badly sanitated, abounds in rank jungle and filthy swamps, has no proper drainage, and contains innumerable cess-pits and accumulations of rubbish. The water-supply, taken from three or four tanks which are preferentially resorted to although the river is not far off, is extremely bad—saturated with impurities—the tanks being ancient and ill kept. Foul wells are also used; but one pucca and ten kutcha wells were sunk at the time of this outbreak. The water of one well in Rajah's Chuck was analysed and found to be chemically very impure. The Magistrate, who visited this town several times, wonders how the inhabitants manage to survive the wet season year by year. The Chapra thana is surrounded by heavy jungle, and Hanskhalli has a reputation for unhealthiness. The mortality in these thanas, as well as in thanna Kishnaghur, is reported to have been enhanced by the deaths in them of pilgrims returning from Nobodip town on their way home. Dr. ffrench-Mullen, Deputy Sanitary Commissioner, Metropolitan Circles, states with reference to a severe outbreak of cholera which occurred in village Toonghi in thanna Kissengunge, the local sanitary condition of which was not very bad, that it was attributable to branches of trees having been steeped by fishermen, who are numerous in the place, in the bhil, in constructing "kamors" for the purpose of catching fish. The boughs decompose in time and the surrounding water becomes saturated with organic matter.

59. *Jessore.*—The mortality from Cholera in this district amounted to 2·69 per 1,000 of population, and the areas of greatest suffering were those noted in the margin. It was noticed that more than half the casualties of the year were recorded in the Bongong sub-division,

	Ratio per mille.		Ratio per mille.

* Garupota " ...	7·48	Kotechandpur " ...	4·33
* Gaighatta " ...	5·45	Harinakunda " ...	4·25
Jessore town ...	4·59	Salikha " ...	3·01

of which the thannas named in the margin distinguished by asterisks form parts. As usual, no account of the prevalence of Cholera in this district has been furnished by the local authorities. The observations of Dr. ffrench-Mullen in the Bongong thana lead him to think that villages situated on the banks of rivers are far more liable to outbreaks of Cholera than those far removed from them, and that villages overshadowed by bamboo jungle and in which the houses are crowded together, are, if the people at the same time use river water, the most liable of all to attacks of the disease independent of insanitary conditions and bad water-supply from other sources; and he asks whether the practice of placing "kamors," or collections of branches in the river at different points to attract fish, have any influence on the water of a large river. Though I disapprove of the kamors, I think the casting of cholera corpses in the rivers is likely to be a much more extensively operating cause.

60. *Khulna.*—Here the mortality stood at 2·09 per 1,000 of population, and only the Damuria and Paikgacha thanas and the Satkhira town returned exceptionally high casualty rates, *viz.*, 3·13, 3·12, and 2·40 per 1,000 of population. There is nothing of importance to relate regarding the Cholera of this district. Dr. Ghose, the Civil Surgeon, instanced some cases of the spread of the disease by human intercourse.

61. *Murshidabad.*—Cholera prevailed in this district with considerably abated activity. The death-rate, amounting to 2·04 per 1,000 of population, was lower by 2·95 per 1,000 compared with that of the preceding year. Nevertheless, in several of the circles the disease exhibited great fatality, *vide* marginal figures. No reasons have been furnished as to why these circles suffered so greatly.

62. The statistics of the Rajshahye Division of Bengal, given in the margin, indicate that larger areas were invaded by the disease in Dinajpur, Rungpore, Bogra and Julpaiguri, and smaller ones in Rajshahye, Pubna and Darjiling, and that the mortality was higher in all the districts excepting Pubna. The seasonal incidence of the disease varied, it will be seen, in each district; but on the whole, March to May and December were the months of severest prevalence. Generally, the greatest amount of rain fell during the months of May to September, but in Dinajpur and Rajshahye the monsoons set in one month later, and in Pubna and Darjiling the rains were prolonged into October.

Cholera prevalence in the Rajshahye Division.

Districts.	Percentage of Villages attacked in 1885.	Increase or decrease as compared with 1884.	Ratio of Deaths per *mille.*	Increase or decrease as compared with 1884.	Increase or decrease as compared with lustrum 1880-84.	Months of greatest prevalence.

63. *Dinajpur.*—The immunity from Cholera which this district enjoyed in 1884 was not continued this year, for it lost 1·92 per 1,000 of its population against only ·31 per 1,000 in the preceding year; but the extremest severity of the disease appears to have been limited to only the five circles marginally named. The Cholera which prevailed in November and December 1884 passed over to this year, exhibiting enhanced mortality in January. In February and March it was present in a subdued form, but became active again in April, culminated in intensity in May, and lingered on with more or less severity to the end of the year. No account has been furnished with

	Ratio per mille.		*Ratio per mille.*
Porsha thana ...	11·11	Gungarampur thana	2·91
Parbutipur „ ...	4·01	Dinajpur town ...	2·70

regard to the history of the disease in the areas above named in which it prevailed prominently, excepting that in the town of Dinajpur it occurred first among persons who had returned to their homes from the Kantanagur fair, 12 miles distant, and that it then attacked people living in their neighbourhood. The outbreak appears, however, to have subsided quickly, indicating that introduced Cholera does not spread in an epidemic form. Contrary to general experience in Bengal, the Magistrate thinks that the abnormal rainfall of the year caused the increase of Cholera in this district.

64. *Rajshahye.*—This district suffered very severely from Cholera, returning a mortality of 5·78 per 1,000 of population, which is the highest in the Rajshahye Division. The circles named in the margin exhibited the highest death-rates.

	Ratio per mille.		Ratio per mille.

Bagmara ,, ...	13·31	Naugaon ,, ...	6·25
Godagari ,, ...	9·26	Mandah ,, ...	5·33
Putia ,, ...	7·94		

It was observed that, while the disease prevailed with more or less severity up to August throughout the district, April and May being the worst months, in the northern thannas of Singra, Panchupore, Naugaon and Mandah it was prolonged into the cold season; but that in the other thannas, which had been inundated by the Ganges in July, there was comparatively no Cholera during that season.

65. *Rungpore.*—This district enjoyed the same amount of freedom from Cholera as it did in the preceding year, the total mortality amounting to only ·88 per 1,000 of population, and only the Kowarganj, Dimla and Mitapukhar thannas presenting noticeable fatal results, *viz.*, at 2 44, 1·98, and 1·90 per 1,000 of population respectively. The Civil Surgeon, moreover, had reason to believe that a good many of the deaths reported as having been caused by Cholera were due to bowel-complaints. Of the three areas in which the disease prevailed with some severity, Dimla is intersected by the Railway. The Magistrate remarks that the November outbreak of Cholera occurred after the breaking up, in that month, of the Alowakawa fair in the neighbouring district of Dinajpur.

66. *Bogra.*—In this district the disease prevailed with great severity, and the mortality was considerably higher than in the preceding year, the death-rate amounting to 4·21 per 1,000 of population, and the increase over the rate of 1884 being so much as 2·31 per 1,000. The marginally-noted areas presented the highest mortality.

	Ratio per mille.		Ratio per mille.
Panchbibi thana ...	12·00	Shariakandi thana ...	3·41
Bogra ,, ...	4·39	Bogra town ...	3·39
Sherpur ,, ...	3·66	Adamdighi thana ...	3·10
Khetlal ,, ...	3 49		

The severity of the disease is said to have been checked by a fall of 12·05 inches of rain in June. The District Superintendent of Police reports that after enquiry he found that Cholera in the Sherpur thanna was attributable to excessive heat and to the people eating whatever food they could obtain at cheap prices, without reference to its wholesomeness, owing to deficiency of crops caused by drought, and that the mortality was enhanced by want of proper treatment of the attacked.

67. *Pubna.*—Here Cholera prevailed with considerably abated severity in comparison with its incidence in the preceding year. The total casualty rate amounted to 1·96 per 1,000 of population, the decrease in mortality being 1·40 per 1,000, and only the Raiganj (4·54 per 1,000), Mathura (3 20 per 1,000 , and Ullaparah (2·99 per 1,000) thannas and the Pubna town (2·22 per 1,000), presented death-rates calling for notice. The Magistrate says that the Cholera in this district was due to polluted and deficient water-supply, the former caused by the steeping of jute in it in October and November, and the latter by all the small tanks or other lodgments of water having dried up in April and May.

68. *Darjiling and Julpaiguri.*—Both these districts continued to enjoy the immunity from Cholera of the preceding year, the mortality being represented by only ·19 and ·45 per 1,000 of population, respectively. In Darjiling the disease was confined to the Darjiling, Kurseong and Phansidewa thanas, the Darjiling town and the Kalimpong rural area being entirely free from it; and in Julpaiguri somewhat high death-rates were returned by only the Keranti and Mynaguri thanas, *viz.*, at 2·03 and 1·05 per 1,000 of population, respectivly. An outbreak of the disease which occurred in Keranti in July, affected chiefly

the coolies in a tea-garden in Dam-dim and was confined to that garden. Contrary to the usual incidence of the disease in Bengal, Cholera prevails most severely in Julpaiguri during the height of the rains from July to September

69. The figures tabulated in the margin show that all the four districts in the Dacca Division of Bengal presented subdued prevalence and fatality of the disease in comparison with its incidence during the preceding year; that the mortality was not conspicuously high in any of them; that in seasonal fatality January, December, April and May took the lead generally; and that the winter severity of the disease was confined to December, excepting that in Mymensing it commenced one month earlier. The largest amount of rainfall occurred during May to September, but the rains were prolonged into October in all the districts.

70. *Dacca.*—After some years of more or less severe prevalence of the disease, this district enjoyed during the year under notice much freedom from it, the mortality extending to only 1·52 per 1,000 of its population, against 3·85 per 1,000 in 1884 and 2 per 1,000 during the lustrum 1880-84, and only the Naraingani and Dacca towns and the Nowabganj and Moonshiganj thanas presented high mortality, the casualty rates in them being 5·01, 2·12, 2·55 and 2·41 per 1,000 of population respectively. The high mortality in the Dacca town is again referred to the non-extension of filtered water to the whole of it, necessitating the use, by the greater portion of its population, of impure water, one or more filthy wells existing in every compound. I should add to this cause the highly insanitary conditions which yet obtain in this town. It has been recorded in former reports that in years of low floods it is not unusual for cholera to be severe in September and October and even in July and August, and this opinion seems to receive confirmation by the events of this year, for the inundations being unusually severe, the usual second outbreak of the disease was curtailed in duration, for it was postponed and limited to December.

71. *Faridpur.*—The mortality from Cholera in this district amounted to 2·15 per 1,000 of population, which is less by so much as 3·19 per 1,000 in comparison with the death-rate of 1884. Only four of its 14 circles exhibited noticeably high casualty rates, *viz.*, those marginally named.

Putuakhalli „ ...	3·93
Barisal town ...	3·79
Golachipa thanna ...	3·43

During an outbreak of the disease which occurred in the Barisal town in March, the Civil Surgeon personally ascertained that the sanitary condition of the part of it which had been affected, called Amanutganj, situated to the north and divided from the south and most healthy portion of the town by a khal or tidal nullah, was very bad. A great portion of it was covered by jungle, and a large number of more or less deep pits existed, several of them containing stagnant water and uncovered night-soil deposited by the municipal mehters. The stench from these pits was sickening. The town of Jhalokati is reported to have, as in the last year, suffered very severely from cholera, nearly one-half

of its total mortality having been caused by the disease. Its sanitary condition under every head "is the worst in the district."

73. *Mymensing.*—There was less Cholera in this district than in 1884. The mortality stood at the low rate of 1·75 per 1,000 of population and only the four circles noted in the margin returned high death-rates. The disease appears to have passed over from the past to the year under review and to have exhibited great severity in June and again in December.

74. The figures of the Chittagong Division denote that the death-rate from Cholera in it was the lowest in comparison with all the other divisions in Bengal; that all its three districts suffered at low rates, only Chittagong exhibiting enhanced fatal results, but to a small extent; and that January to May and December were generally the months of greatest prevalence of the disease. The monsoons commenced in these districts in May and ended in September, but the rains were prolonged into October in Noakhali and Tipperah and into November in Chittagong.

Cholera prevalence in the Chittagong Division.

Districts	Percentage of Villages attacked in 1885.	Increase or decrease as compared with 1884.	Ratio of Deaths per mille.	Increase or decrease as compared with 1884.	Increase or decrease as compared with 1880-84.	Months of greatest prevalence.

75. *Chittagong.*—The mortality from Cholera in Chittagong stood at the low rate of 1·58 per 1,000 of population, but the Civil Surgeon is of opinion that this ratio does not represent the entire mortality which actually occurred, as the year was not only in Chittagong, which has a bad reputation, but in most parts of India, very unhealthy. In support of this opinion he writes:—"I have never treated so many Europeans from this disease as I unfortunately have had to do during July and August, and I had cases varying from the most malignant Asiatic Cholera killing in a few hours, down to the simplest and mildest forms of the disease. The circumstances of the individuals attacked were so various, differing in habits, manners, temperament, diet and general surroundings, that I am quite unable to formulate any theory respecting it." Marginally are exhibited the areas of greatest suffering. The severity of the disease in the Chittagong town is ascribed to the very grave insanitary conditions which obtain in it. The town is "simply a forest in deltaic soil, with villages interspersed throughout its whole extent, cut up by streams from the springs, tidal creeks and innumerable tanks and excavations." The condition of this town has long engaged the attention of this office, but, notwithstanding the monetary assistance given by Government, the Commissioners appear to be in a chronic state of inability to effect much good in it.

76. *Noakhali and Tipperah.*—Both these districts appear, on the whole, to have suffered very mildly from Cholera, the mortality in them being represented by only 1·43 and 1·77 per 1,000 of population, respectively. Excepting the Chagulnya thana (4·78 per 1,000) in Noakhali, and the Daudkandi thana (3·35 per 1,000) in Tipperah, no other circle presented a high death-rate. It is stated, with reference to the presence of the disease in Chagulnya, that it was imported into it from Tipperah by men who went there to cut grass. In a few villages in thanna Muradnagar in Tipperah, the disease prevailed epidemically and 83 deaths occurred in one single day in December in four of the villages.

BEHAR.

77. The returns of the Behar Division of the Province show that of its population estimated at 23,127,104, 65,663 died from Cholera in 11·66 per cent. of its villages, the proportionate death-rate to population being 2·83 per 1,000. The casualty

Cholera prevalence in the Behar Division of the Province.

rate during the preceding year was ·76 per 1,000 in 4·83 per cent. of the villages, and in the quinquennium 1880-84, 1·29 per 1,000. There was thus a considerable increase both in the extension and fatality of the disease in comparison with the outcomes of both the periods above mentioned. The months of highest suffering which in Behar are usually from May to August, were this year prolonged to November.

78. The statistical information relating to Cholera in the Bhagulpore Division, presented in the margin, indicates that there occurred considerable increase both in the prevalence and fatality of the disease in all the five districts which comprise it, notably in Maldah, in comparison with the outcomes of the preceding year and of the lustrum 1880-84; and that in seasonal fatality, with some variations in commencement, July to November were the worst months, excepting in Purneah and Maldah. In the former the disease did not become severe till September and continued to maintain this tendency up to December, and in the latter there was an abatement of severity in August and September, but the winter epidemic was prolonged to December. June to September were generally the months in which the largest amount of rain fell, excepting that in Monghyr the monsoon set in a month later.

Cholera prevalence in Bhagulpore (*East Behar*) Division.

DISTRICTS.	Percentage of Villages attacked in 1885.	Increase or decrease as compared with 1884.	Ratio of Deaths per *mille*.	Increase or decrease as compared with 1884.	Increase or decrease as compared with lustrum 1880-84.	Months of greatest prevalence.

79. *Monghyr.*—Although Cholera did not prevail very extensively in this district, the mortality was high. It amounted to 3·06 per 1,000 of population, and exceeded the death-rate of 1884 by 2·36 per 1,000. The disease proved most fatal in the marginally noted circles. From a report from the District Superintendent of Police, it appeared that the high mortality in thanas Jamalpore, Shaikpura, Sekundra, Jamui and Monghyr was referable to excessive heat and to the poor people, among whom it principally occurred, being compelled to subsist on articles not easily digestible, such as jack and other fruit, owing to heavy prices for food-grains.

80. *Bhagulpore.*—In this district over 19 per cent. of the villages was overrun by the disease, and the mortality was high, amounting to 3·41 per 1,000 of population, and exceeding that of 1884 by 2·60 per 1,000. The circles marginally noted furnished the highest death-rates. Thanas Banka, Amarpore and Katoria are reported to have suffered epidemically in July and August, when 1,422 persons were attacked and 1,213 died. The disease is supposed to have been imported into these thanas by travellers from Deoghur and from a village in Monghyr bordering on the north-west of thana Amarpore. It is also mentioned that the inundations which prevailed during the rainy season, specially in the north of the district, favoured the prevalence of Cholera. Thanas Pertabgunge and Bongong are situated in the north. The former returned a death-rate of only 1·27 per 1,000 of population, and the latter stands sixth on the above list of circles which suffered most, with a death-rate amounting to 2·96 per 1,000.

81. *Purneah.*—This district did not enjoy this year the immunity from Cholera which it experienced during the preceding year; but, although the mortality was higher by 1·35 per 1,000 of population, it was not excessive, as it

	Ratio per mille.
Kusba Amour thana ...	4·82
Balarampore „ ...	3·82
Ranigunge „ ...	3·22
Dhamdaha „ ...	2·88
Arareah „ ...	2·03

amounted to only 1·57 per 1,000, and in only the five circles named in the margin the casualty rates were noticeably high. It was observed that Arareah thana, which was not influenced by the inundation being high and dry, suffered much from Cholera, but that the low lands to the south and south-east, comprising thanas Manihari, Gundwara, Kadwa and Balarampore, which were extensively flooded by the Ganges in August and September, had the fewest number of cases. An examination of the statistics supports this statement to a great extent, for while Arareah returned a death-rate of 2·03 per 1,000 of population, in the other thanas, with the exception of Balarampore which occupies the second place in the above list of high-suffering areas, the casualty rates stood at only ·16, ·73, and 1·25 per 1,000 of population, respectively. From enquiries made by Dr. Wood, the Deputy Sanitary Commissioner, Darjiling circle, it appeared that the presence of the disease in this district was supposed to be due to importation, viz., into the Arareah and Ranigunge thannas from Durbhanga across the Kosi river, where Cholera was present at a fair; into the Damdaha thanna from beyond the Kosi from Bhagulpore; and into thanna Balarampore from Maldah in the south. Dr. Wood found most of the villages visited by him to be, in a sanitary point of view, worse than an average busti, with filthy surroundings consisting of middens, of accumulations of decomposing cattle ordure and refuse, of pits full of stagnant water, of ground saturated with the liquid excreta of cattle and human beings, and of house refuse water oozing through the fences and making the pathways filthy, or soaking into the ground within the house enclosures; no conservancy or drainage arrangements; the water-supply contaminated in most cases, &c. He also mentions that the dead thrown into streams were numerous, and he apprehends that the next spring epidemic visitation of the disease will be on a larger scale. It was noticed by the Civil Surgeon that the disease in its severe form appeared in October—an unusual time for this district.

82. *Maldah.*—This district suffered very severely from Cholera, considerably more so than during the preceding year—in fact it stands second on the list of cholera-stricken districts. The disease was present in over 23 per cent. of the villages, and 6·17 per 1,000 of the population fell victims to it, against only 1·62 per 1,000 in 1884, and all the circles in the district returned exceptionally high mortality, *vide* marginal figures. The disease appeared in March, became active in April, attained maximum severity in May, declined through June to September, and then increased; but the winter severity was, it is said, not so great this year as is usually the case in Maldah, and this is attributed to the inundation, which submerged the entire district, excepting its northern frontier. The Deputy Sanitary Commissioner, Darjiling circle, also notes that inundations and fires were the chief cleansing agencies in the villages in Maldah. The statistics, however, do not quite support this view of the matter, for, while they indeed show that the greatest suffering occurred during April, May and June with death-rates of 1·28, 1·80, and ·76 per 1,000 of population per mensem, and that in October, November and December they stood lower, viz., at ·34, ·28 and ·25 per 1,000, the figures of the same months in 1884, during which the inundations were low, were ·01, ·05, and ·32 per 1,000 respectively. The Civil Medical Officer says that Cholera is intimately connected with bad drinking-water. This year the drinking supply was very bad, owing to the diminished rainfall of the previous two years having caused the tanks and water reservoirs to run very low, and the bhils and rivers had become foul from decomposing vegetation and organic matters. The prolonged drought, greater heat, general insanitary conditions of the villages and the careless manner in which the people dispose of Cholera excreta, intensified the severity of the disease. Moreover, it is a common practice to burn dead bodies on the banks of the bhils and old river courses, the water of which is used for drinking purposes. It appears that the Magistrate took energetic steps personally and through the chowkidars, to

	Ratio per mille.		Ratio per mille.

stop this practice, and that his endeavours were attended with considerable improvement. It was also noticed that the middle classes of the people who improved their water derived from ponds and bhils by putting alum into it, or allowing it to subside before drinking it, suffered from Cholera in lesser numbers than the poorer classes who used the same water in its original condition. The Magistrate also states that in Gajol in the north-east and in the greater part of Old Maldah, which are the most unhealthy places in the district, and where Cholera prevailed severely, the people generally drink the foul water of the bhils and of old tanks half filled with jungle and often covered with weeds. He addressed letters to the landholders to improve their tanks without avail, most of the replies given being of an evasive character.

83. *Sonthal Pergunnahs.*—This district lost 3·30 per 1,000 of its population from Cholera, and this death-rate exceeded that of the preceding year by 1·57 per 1,000. All the circles in it presented noticeably high mortality, as the figures in the margin denote. In the town of Deoghur the pilgrims who came to the temples at Boydanath as well as the residents suffered. Active sanitary measures were adopted, which resulted in arresting the progress of the disease. In the Godda sub-division Cholera prevailed with considerably greater severity, the mortality being represented by 2,083 deaths against 390 in 1884. It invaded 1,611 villages, and its activity was greatest from June to August, maximum intensity being attained in August. There was some increase of the disease in the sub-division of Deoghur, including Jamtara, the casualties numbering 1,240 against 1,000 in 1884. In the Pakour sub-division 712 persons were attacked in 112 villages, but the mortality was lower, the deaths numbering 485 against 659. In the sub-division of Rajmehal the disease attacked 44 villages and caused 593 deaths. In the sub-division of Dumka the disease prevailed very severely and was present throughout the year. One hundred and thirty-one villages were affected, 882 persons were attacked, and 783 died. The reports show that when Cholera was prevailing epidemically in the villages adjoining the Dumka and Sahebgunge towns, steps were taken to keep the towns and dwelling-houses clean, to prohibit the use of bad food and water, to have the Cholera ejecta disposed of properly and safely, to burn sulphur, &c., and that with these precautions, supplemented by copious rainfall, the disease disappeared from the former town after causing only six deaths, and did not attack the latter.

84. In the Patna or Western division of Behar, Mozufferpore experienced the greatest suffering from Cholera, Patna the least, and the rest of the districts intermediately; and all the districts, excepting Patna, exhibited enhancement in both the extension and fatality of the disease in comparison with the results of both the preceding year and the lustrum 1880-84, Gya showing diminution contrasted with the last-named period. The months of severest prevalence varied somewhat in the districts individually considered, but on the whole June to November may be said to have been the worst months. The monsoon commenced in June and ended in September in all the districts, excepting Patna and Sarun, where it appeared one month earlier.

Cholera prevalence in the Patna (*West Behar*) Division.

Districts.	Percentage of Villages attacked in 1885.	Increase or decrease as compared with 1884.	Ratio of Deaths per mille.	Increase or decrease as compared with 1884.	Increase or decrease as compared with lustrum 1880-84.	Months of greatest prevalence.

Dinapore „	2·31
Patna thana	2·29
Maner „	2·12
Barh town	2·11

disease, excepting that in the Behar town it prevailed epidemically during July and August

86. *Gya.*—Although the mortality was not, on the whole, high, this district did not enjoy the immunity from Cholera this year which it did during the preceding year. The death-rate stood at 1·39 per 1,000 of population against 95 per 1,000, and the areas of greatest suffering were the Gya town (6 66 per 1,000) and the Nowada and Arwal thanas (2·66 and 1·98 per 1,000 respectively). It was noticed that 101 deaths occurred among the pilgrims who passed through this district. No other point of interest is contained in the local reports.

87. *Shahabad.*—Here also there was an accession of mortality to the extent of 1·34 per 1,000 of population, but the total death-rate, amounting to 2·24 per 1,000, was not excessive. The circles named in the margin furnished the highest death-rates. There was no Cholera in the jail although it existed in the town. Contrary to the experience of former years when the disease prevailed most severely from May to August, this year its virulence was exhibited during the months of August to October, being worst in the last-named month.

	Ratio per mille.
Mohania thana	5·81
Dumraon town	5·21
Arrah „	4·44
Buxar thana	3·70

88. *Mozufferpore.*—Cholera prevailed in this district much more extensively and fatally than during the preceding year, and the mortality here was much greater than in any other district in the Patna Division. The total death-rate was 4·82 against only ·12 per 1,000 of population, and over 20 per cent. of the villages was pervaded by the disease. All the circles, excepting the Hajipore and Mahua thanas and the Lalgunge town, returned noticeably high death-rates, *vide* marginal figures It was in May, when the rains set in, that cases of Cholera became more frequent and severe, and as the rainy season advanced the disease became established nearly all over the district. It did not, however, prevail epidemically, and the Civil Surgeon had reason to believe that more deaths from Cholera had been reported than had actually occurred. An instance in point is that when the Police reported that Cholera had broken out in a virulent form in mohullah Chandwarah in the town of Mozufferpore, two hundred houses were inspected and only five cases of the disease were seen, but fever associated with diarrhœa was much more prevalent. The Civil Surgeon states that a wave of Cholera has certainly passed over North Behar, and that if there is any truth in the theory so earnestly advocated by the late Dr. Bryden, a severe outbreak may be anticipated during the coming year.

Paru „ ...	6·65	Mozufferpore thana ...	2·66

89. *Durbhanga.*—In this district also there was a considerable increase of Cholera prevalence after it had enjoyed much immunity from it in 1884. The total mortality was returned at 2·78 against only ·28 per 1,000 of population, and the circles of intensest suffering were those indicated in the margin. In seasonal incidence of the disease there was a difference this year. Instead of prevailing with severity during the dry hot months of April and May, its virulence was greatest during June to September in the face of a heavy rainfall, which usually checks the progress of the disease in Lower Bengal; and although the September rainfall amounted to 24·74 inches, the disease went on increasing until October, in which month it reached maximum intensity. Thanas Rosera, Tajpore and Dulsingserai were almost free from the disease, and it was altogether absent from the jail, although it prevailed with marked severity in the town of Durbhanga. The Civil Surgeon observes that the spread of Cholera is in proportion to the insanitary condition of the infected area, and the Magistrate, agreeing with him, furnishes the following lamentable account of the villages in Durbhanga. He says that these villages are in marked contrast with the majority of those in Eastern or Central Bengal. In the Durbhanga villages one meets constantly with the most disgusting and revolting sights, and is always overpowered with the most abominable smells. The sides and centres of the roads are strewn with human ordure. It would

	Ratio per mille.		Ratio per mille.

Benipatti „ ...	3·88		

appear that all classes, without exception, had by common consent agreed to use the main street as the principal latrine of the village, the consequence being that night and day a deadly fœcal odour pervades the whole atmosphere, and it is a fearful ordeal in the morning to thread one's way in safety through the uncleanliness and filth with the village pigs brushing against the legs in their haste to devour the noisome repast. He believes that the entire soil of the villages must be saturated with the filth of ages, and wonders how human life in Durbhanga is not always subjected to the ravages of disease. The villages in the Sudder and Madhubuni sub-divisions, being on a lower level than those in the Tajpore sub-division, are perhaps more unhealthy than the latter.

90. *Sarun.*—The mortality from Cholera in this district, although not excessive on the whole, was much greater than in the preceding year. It stood at 1·99 against ·58 per 1,000 of population, and 11·42 per cent. of the villages was overrun by the disease. The numbers of cases and deaths reported by the Police from the commencement of the malady in its severe form in August to the time when it practically terminated in the end of October, are given in the margin, and below them are noted the circles which contributed most largely to the mortality of the year.

Existing in sporadic form prior to June, the disease became severe in that month, and in August and September assumed epidemic type, when it caused much loss of life generally. It was not confined to any special locality, but was spread over the whole district, proving more fatal in some places than in others; but a peculiar feature of the disease was that, though not pursuing any definite course, it clung persistently to the places it had attacked, breaking out again in them after its apparent disappearance. It began to decline in severity by the middle of October, and almost entirely disappeared by the end of that month. It broke out virulently in some of the villages in the Maharam, Pursah, Busuntpore and Buragaon police-stations, but it ran its course quickly in these places and disappeared before assistance could be rendered. No account, excepting from Chupra town, has been furnished of the Cholera prevalence in the places marginally cited above, although it was notably fatal in the towns of Revilgunge and Sewan. In the Chupra town the disease made its appearance in a virulent form in the middle of August and disappeared after October, causing the greatest loss of life in the first-named month. There is no doubt that the extremely insanitary condition of the town enhanced the severity of the disease. Every endeavour was made to arrest its spread. The drains were cleaned and drained of stagnant water; sulphur and other disinfectants were freely used; dead bodies were properly buried or thoroughly cremated; the drinking wells were carefully protected from pollution; care was taken to afford early treatment to the sick; a set of rules, designed to check the spread of the disease, framed by the Civil Surgeon, was circulated through the agency of the Police, &c. These efforts to check the disease proved, it is said, successful in so far that the number of deaths commenced to diminish daily, but the disease itself lingered on. The case of Chupra furnishes a vivid illustration of the evils of neglected sanitation. The efforts made to check the progress of the disease cost much money, which, instead of being spent in this emergency, could have been much better employed in carrying out permanent sanitary improvements, and thus guarding the town from the visitation of the disease. It required 16 gangs of coolies of 12 men each to clean out the drains, and 50 chowkidars, each paid at two annas a day, to guard the water-supply. There are 37 permanent mehters, and yet the drains were allowed to run into such a state of uncleanliness as to require the enlistment of a large staff of extra coolies to put them into order—in fact, the town has a large conservancy establishment, but the Commissioners get very little work for their money. A remarkable contrast proving the efficacy of sanitary precautions, is the jail.

This institution was free from the disease when it was prevailing in the town, as special care was bestowed in guarding against its invasion. The pains taken in this direction reflects great credit on Dr. Russell, but tells seriously on the management of the Municipality. One of the chief evils in Chupra is its defective drainage. The town is a straggling one covering a large area; and lying in a valley and being below the level of the river in high floods, the introduction of a good and perfect drainage system into it, is, it is said, difficult, except at prohibitive cost. The Magistrate thinks that my suggestion to provide a system of saucer drains would be quite insufficient to carry off the rain water even if there was anywhere to carry it to, while deep pucca drains are beyond the means of the Municipality. He questions whether the substitution of pucca drains for the kutcha ones would benefit public health, and believes that all that is necessary is to thoroughly clean out all the drains once a year at the end of the hot weather and before the rains come in, and to remove all accumulations of silt and obstructions—and he proposes to employ the surplus funds in other directions, such as providing proper burning ghats and slaughter-houses and strengthening the conservancy establishment. I dissent from this view of the matter. Pucca drains would enable house sewage to get out of the town at all seasons, which it does not do at present, and would facilitate quick discharge of heavy falls of rain, and thus prevent dampness. The cleansing of drains once a year is habitual in Behar, and leads to the accumulation of house sewage, &c., throughout the whole dry season when all drains become interrupted cess-pools. It is as cheap to keep the drains always clean as to clean them out after they are choked. The burning ghats being situated at a distance from the town, their condition does not materially affect its health.

91. *Chumparun.*—This is another district in the Patna Division which did not enjoy the immunity from Cholera which it experienced during the preceding year. Although the disease was present in only 7·88 per cent. of the villages, it caused the heavy mortality of 3·99 per 1,000 of population, the excess in comparison with the death-rate of 1884 being so much as 3·62 per 1,000. Every circle in the district presented high death-rates, *vide* figures in the margin. It appeared in thana Baguha in the last week of April, and immediately after in other parts of the district far apart from each other. From May, thana after thana was involved, and increasing in fatality it spread over the whole district in August. In September it reached maximum intensity and was most fatal. Continuing severe in October, it rapidly declined in November and December. From July when the disease began to assume serious form, till the first week of November after which it almost left the district, there occurred, according to the Police reports, 8,002 cases attended with 5,881 deaths. The rainfall was much larger in quantity than in the preceding year, particularly in July, August and September, and the rivers rose and a much larger portion of country than usual was inundated. The Civil Surgeon observes that there is a connection between excessive rainfall and Cholera prevalence, as disease prevailed with greatest virulence during August, September and October, when the rains were at their height, but as the country dried up, the disease subsided rapidly. The sub divisional officer of Bettiah says that the Cholera which prevailed in the Bettiah town was prevented from assuming an epidemic form by the sanitary precautions which were taken, and by the fires which occurred having cleansed it of impurities; but it has been shown above that this town returned the highest death-rate. Under the orders of Government I specially visited this town to enquire into its health status. I found its drainage very bad, and that the preparation of any adequate scheme for its proper treatment was beyond the means of the Municipality. I therefore suggested that Government should spare an Engineer to survey the town and prepare a drainage scheme, and that the local wealthy zemindars and others be asked to render assistance in carrying it out.

The Civil Surgeon notes that it was very fortunate that the Cholera epidemic did not declare itself in the Motihari town until the cultivators, who had come for their opium weighments, had left it, otherwise the consequences would hardly have failed to be particularly disastrous. The five wells around the opium godowns were in a bad state of repair, and they were all, with one exception, drawn dry by midday. The excepted well was situated under trees, and its water looked unpleasant and was certainly filthy. This deficient supply of impure water was used by over 4,000 people who visit the town during the opium weighments. The Magistrate reports that a special reference will be made to the Commissioner of the Division regarding the improvement of the water-supply. Under Government orders I specially visited not only this district, but also Patna, Gya, Mozufferpore, Durbhunga, Sarun and Hazaribagh, to enquire into the sanitary arrangements which obtained at the places in which cultivators assemble for the weighment of opium. I found that some sanitary precautions had been taken, and that the danger of outbreaks of epidemic disease at these assemblies was recognized by the Opium Department Officers; but that the measures adopted by them were in the majority of cases defective and not commensurate with the actual needs of the places. I, therefore, made the following recommendations in view of proper sanitary precautions being observed:—

(1) That it should be incumbent on the Officers of the department to provide a good and sufficient water-supply, and that this, as a rule, can only be done by digging wells so deep as to ensure their yielding an ample supply during the hot and dry season.

(2) That in addition to groves of trees (if they exist) for shade and shelter, it would be advisable to provide for protection from storms a number of small huts which should be well apart and must not accommodate a large number of persons.

(3) That there should be a small staff of mehters to provide for the general cleansing of the camps, to dig trench latrines and erect mats round them; that these latrines should be situated in open cultivated fields, and not less than 150 yards from the encampment; and that the mehters should be in constant attendance, morning and evening, to cover up the night-soil and prevent the latrines being offensive.

(4) That as many cultivators will be averse to the use of latrines, a limit within which they may not ease themselves should be fixed around the camp, indicated by posts of bamboo or wood.

(5) That in case of epidemic disease appearing, the weighments should be pushed on rapidly and the cultivators allowed to return to their homes as soon as possible; that fires should also be burned throughout the encampment with sulphur thrown in at frequent intervals; and that the sources of drinking water should also be changed, and the cultivators encouraged to boil water before drinking it.

(6) That where there are not ample food supplies, bunniahs should be encouraged to open shops.

(7) That the expenses of all the above arrangements should be borne by the Opium Department, who should also subsidize local dispensaries to enable all comers to obtain an early and suitable supply of medicines.

(8) That all weighments should be made as early in the season as possible, specially in the Hazaribagh district, where epidemic cholera appears earlier than in the districts of Behar.

ORISSA.

Cholera prevalence in the Orissa Division.

92. The statistics bearing on Cholera in the Orissa Division of the Province show that 19,140 persons fell victims to the disease among its population numbering 3,628,832 in 23·21 per cent. of its villages, the proportionate casualty-rate to population being 5·27 per 1,000. The figures of the preceding year and of the quinquennium 1880-84 were—deaths 17,983 and 11,958, and death-rates 4·95

and 3·29 per 1,000, respectively. This comparison indicates that the disease prevailed with enhanced severity, but that the increment was not, on the whole, considerable. This Division suffered at a higher rate than the three others in the Province.

93. In the margin are tabulated the Cholera statistics of the three districts which compose the Orissa Division. They indicate that two of them, Cuttack and Puri, suffered very severely from the disease, and that the mortality returned by them was much higher than during both the preceding year and quinquennium 1880-84; and that in the third district, Balasore, while the death rate was still noticeably high, it had diminished very considerably in comparison with that of 1884, and in a small proportion as contrasted with that of the preceding lustrum. The seasonal severity of the disease differed this year. In former years January, February, March and August were comparatively healthy months and June the month of culminating severity. This year the four healthy months formed the period of much suffering, and the worst months were November in Cuttack, February and July, at an equal ratio, in Puri, and April, November and December, also in equal degree, in Balasore. The greatest amount of rain fell during July to August in Cuttack and during July to September in Puri and Balasore In Cuttack and Puri the rains were prolonged into October.

94. *Cuttack.*—In this district Cholera invaded over 28 per cent. of the villages and caused the high mortality of 5·74 per 1,000 of population. The rates at which the different circles in it suffered are indicated in the margin. The severe cyclonic storm-wave, which occurred on the 22nd September, and particulars regarding which have been furnished in paragraph 38 of this Report, is said to have considerably enhanced the mortality in this district. This calamity is reported to have affected chiefly thanas Aul, Patamundi, Kendrapara, Jajpore and Dharmsala. Of these thanas Dharmsala, Aul and Jajpore appear to have suffered very much, for they furnished the highest mortality; not so Patamundi and Kendrapara, as will be seen from the above marginal figures. But, as the chief suffering is reported to have occurred after the cyclone, it is necessary to see from the monthly death rates in these thanas whether the above fact can be established. These monthly figures are given in the margin. They indicate that there was certainly a rise in mortality in all the five thanas, particularly in Aul and Jajpore, and chiefly in November; but Dharmsala appears to have also suffered much during March, April and May, due no doubt to other influences. The causes in association with the cyclonic storm-wave which brought about the high suffering in these and the other thanas which were affected by it, briefly stated were: exposure and hardship for want of shelter; want of, or consumption of bad food, the food

stores having been destroyed or damaged; and bad water, which was generally contaminated by the dead bodies of human beings and animals, by fallen trees, and other sources of impurity, and, on the sea-coast, by the tanks and wells having been filled with salt water. The Civil Surgeon adds that in general the prevalence and spread of Cholera in February and March were due to insanitary conditions, particularly with regard to the water-supply taken from tanks, wells and rivers, which are contaminated in various ways and the impurity of their water intensified in the dry weather by evaporation.

95. *Puri.*—In this district also the fatality of Cholera was very great, the death-rate being represented by 5·98 per 1,000 of population. In fact there was more Cholera in the district this year than in any year since 1878. All the circles in it experienced high suffering, as will be seen from the figures given in the margin. The outbreak of November 1884 appears to have passed on to this year, and the virulence of this outbreak was intensified in February and again in July by in-coming pilgrims. Dr. Lyons has again taken great pains to connect Cholera with pilgrims, and the records certainly support his statements, for the increase of mortality corresponds with the times during which there are influxes of pilgrims—in February for the Dole Jatra, in July for the Ruth Jatra, and in November for the Panchak Jatra—and the reduction with the months during which the pilgrims are absent. There are a few points in his notes which are worthy of record. He observes that the July outbreak of the disease, which is usually severer than the two others, was intensified this year by an unusually large influx of pilgrims owing to the Ruth Jatra of this year "having been predicted as an auspicious one, so that on the 14th of that month, the first day of the Car festival, it was estimated that sixty thousand pilgrims were assembled in the Baradand to witness it." With regard to Cholera in the town of Puri, where the mortality was unprecedentedly severe this year, it was observed that the periods of increase and decrease of the disease were more defined than in the district, so as to make it, in Dr. Lyons' opinion, certain that it is not of local origin, but imported; for after the outbreak at the time of the Dole Jatra festival it subsided to a minimum of six, three, and five deaths in April, May and June, and that again on the return of the pilgrims in July the deaths rose to 444 in that month, after which it commenced to decline, so that in August there were 31 deaths, in September one, and in October nine; but in November, when the Panchak festival was celebrated, the deaths rose to 106 and was followed by an abatement, the December deaths numbering nine. It appears that Telengs from Madras and other pilgrims from the south having passed Banpur thana in order to reach Puri town enhanced the mortality in this thana. With regard to Gope, which is off the pilgrim route, it is observed that, although the mortality in it was lowest at the times of the Ruth and Panchak festivals in June and November, viz., at ·04 and ·06 per 1,000 of population, in February, at the time of the Dole Jatra, it was greatest in comparison with those of all the months of the year, viz., at 1·81 per 1,000, the death-rates of the other months ranging from ·12 to ·56 per 1,000. This is ascribed to the pilgrims having revisited the Black Pagoda at Kanarack. Independent of this visit, which also took place in some former years without enhancing mortality, an additional reason why the February death-rate was high in Gope is that Cholera was more generally prevalent in the district in that month and continuous from the preceding year. Enough, however, is not known of the previous history of the pilgrims to establish the fact of cholera introduction by their agency, though their presence in Puri undoubtedly indicates the periods of epidemic prevalence. It is to my mind more reasonable to assume that the conditions under which they have lived when travelling, and do live when attending the festivals, are the determining causes of the appearance of the malady, although individual instances of introduction may no doubt be found as are naturally to be looked for. It must not be forgotten also that the death-rates are reckoned on the census population of the town, which is greatly increased at times of festivals. Whatever theoretical views Dr. Lyons may hold on the subject of causation, he attends well to the sanitary wants of the town of Puri.

Puri town ...	28·76	Pipli thana ...	4·46
Banpur thana ..	11·08	Khurda "	4·39
Puri " ...	6·88	Gope "	3·89

The increase of Cholera *generally* in the district is referred to the fact that the rainfall was very deficient, amounting to 49·74 inches against 60·13, the average of preceding years.

In addition to the measures usually adopted before and during outbreaks of cholera at pilgrimage times, a compounder with cholera medicines was stationed at Saradaipur (the first stage from Pipli on the Cuttack side) and another at Satrabadi (the first stage from Puri) to complete the chain of relief stations at the three principal halting grounds along the Jagarnath Road, from July to the end of the Car festival, to afford aid to pilgrims who may be attacked by cholera, diarrhœa, or dysentery. The lodging-houses were regularly inspected, with the result that many cases of overcrowding and the sale of a kind of mohaprosad made of rice and cooked with coarse sugar or *goor*, bad in quality, generally hard as a stone, mouldy and lumpy, and sold in enormous quantities, were detected. The sale of this objectionable food has very nearly been stopped in the bazar, but cannot be reached within the precincts of the temple. In some cases the overcrowding was serious, and the smell in the rooms sickening. There is no doubt that this overcrowding and the use of this mohaprosad were associated with the other causes which produced the high mortality of the year.

96. *Balasore.*—This district did not occupy this year the unenviable position which it did in the preceding year, viz. that of first on the list of cholera-stricken districts. Although the death-rate was noticeably high, amounting to 3·71 per 1,000 of population, it had diminished by so much as 4·08 per 1,000. The circles which returned the highest death-rates are those named in the margin. The high mortality in Dhamnagar, which occurred principally in October and November, was, it is suspected, caused by the consumption of rice which was rendered unfit for human food by the storm-wave of September. This rice was destroyed as promptly as possible.

CHOTA NAGPORE.

97. The records of the Chota Nagpore Division of the Province indicate that 6,582 deaths from Cholera occurred in it during the year under review in 4·05 per cent. of its villages and among a population of 4,334,178, representing a death-rate of 1·51 per 1,000. The incidence of the disease during the preceding year resulted in 3,438 deaths in 2·24 per cent. of the villages, or at the rate of ·79 per 1,000 of population, and during the lustrum 1880-84 in 1,613 deaths, or at ·37 per 1,000 of population. These figures demonstrate that there was an increase in both the prevalence and fatality of the disease in comparison with the outcomes of the periods above mentioned. On the whole, however, the mortality was not excessive, and compared with the death-rates in the other Divisions of the Province, it was the lowest.

Cholera prevalence in the Chota Nagpore Division.

98. The marginal table presents the Cholera statistics of the four districts in the Chota Nagpore Division of the Province. Relatively considered, of these districts only Hazaribagh exhibited a high rate of mortality. In association with former periods, Hazaribagh, Lohardugga and Singbhum furnished returns indicating greater prevalence and fatality of the disease in comparison with both the preceding year and the lustrum 1880-84, but Manbhum exhibited a diminution under both heads as compared with 1884 against an increase of mortality as compared with the quinquennium 1880-84. The months of greatest prevalence of the disease varied in these districts. In Hazaribagh and Manbhum the period commencing in May was prolonged into

Cholera prevalence in the Districts in Chota Nagpore.

Districts.	Percentage of Villages attacked in 1885.	Increase or decrease as compared with 1884.	Ratio of Deaths per mille.	Increase or decrease as compared with 1884.	Increase or decrease as compared with lustrum 1880-84.	Months of greatest prevalence.
Hazaribagh ...	6·48	4·19 *I*	3·35	2·19 *I*	2·88 *I*	May to October.
Lohardugga .	·76	·58 *I*	·47	·36 *I*	·33 *I*	August to October.
Singbhum ...	2·61	1·88 *I*	·60	·41 *I*	·42 *I*	April and June.
Manbhum ...	4·70	·95 *D*	1·66	·08 *D*	·95 *I*	May to July.
Total ...	4·05	1·81 *I*	1·51	·72 *I*	1·14 *I*	May to September.

October in the former district and limited to July in the latter. In Lohardugga it commenced later, that is, in August and extended to October. In Singbhum it lasted only two months, April and June. The largest amount of rain fell during June to September in all the districts, but in Singbhum the rains were prolonged into October.

99. *Hazaribagh.*—In this district Cholera did not prevail very diffusely, as only 6·48 per cent. of the villages were affected; but the mortality caused by it was great, amounting to 3·35 per 1,000 of population. It did not enjoy the immunity from the disease which it experienced for years past, inasmuch as only 1·16 per 1,000 of the population were carried off by it in 1884 and ·47 per 1,000 during the lustrum 1880-84. The marginally named circles furnished the highest casualty rates.

			Ratio per mille.				*Ratio per mille.*

				Bagodhar	"	...	2·27

Of these circles Chatra is situated in the extreme west of the district, Hazaribagh in the central part, and the rest in the north and east. As to the local distribution of the disease, it again followed its usual course. Commencing in the north and east in the spring, as usual, it confined itself to the lower levels of the district till the rains set in, then spread to the higher levels in the south and west, and disappeared as the cold weather set in. In connection with seasonal fatality it assumed serious proportions with the setting in of the rains in June, became epidemic and raged all over the district during the next month, excepting in thanas Simoria and Ramghar, reached maximum intensity in August, declined considerably in September, exhibited further abatement in October, and disappeared by the middle of November. The outbreak in the town of Hazaribagh, resulting in the high mortality exhibited above, commenced on the 22nd June and lasted till October, proving most fatal in July and August. The Civil Surgeon says that the majority of the cases occurred in the outlying villages of Khirgaon, Ooregah, Mutwari and Murrai, and that the town and bazar suffered comparatively little. He found these villages in an insanitary condition. There was an entire absence of drainage, the houses were old and rotten, filthy accumulations abounded, the wells were shallow and highly polluted, &c. A large gathering of ryots, who came to Burhi for opium weighments, were attacked in May by the disease. It prevailed very virulently, and it is said that the mortuary return of this month does not contain all the deaths that took place, for the Opium Agent asserts that he never in his experience saw "more wholesale and fearful mortality among his Assamees." Of the men who came to Burhi 15 died at Chandwara, eight miles south of Burhi, thus carrying the disease to this village. This outbreak was attributed to intense heat, entire want of shade and shelter and good water, and absence of sanitary and latrine arrangements. My suggestions for the observance of proper sanitation at these gatherings, which are applicable to Burhi also, have already been submitted to Government, and are given at the end of paragraph 91 of this Report. An outbreak of Cholera occurred at the Madhubun or Parisnath gathering of pilgrims in February. This I consider was the beginning of the disease in the district, and not that which took place among the opium ryots in Burhi above adverted to.

Under orders of Government special enquiries were made by me as to the health conditions of the towns and villages on the Grand Trunk Road and to the north-west of Hazaribagh, where Cholera was alleged to have prevailed severely. My report on the subject, together with suggestions for the better protection of the people from epidemic disease, was submitted to Government. A condensed abstract of that report follows. It should be stated that this enquiry also embraces the district of Manbhum. To make the investigation as complete as possible as bearing upon the influence of the Grand Trunk Road as a means of diffusing Cholera in the Hazaribagh district, I began my inspection at Ranigunge; proceeded thence to Barakur; saw there the conditions under which the great crowds are employed on the coal industry; thence I followed the Grand Trunk Road as far as it traverses Manbhum and up to Burhi, visiting every place of importance either on or near the road, examining carefully the chattis or bazars which have grown up round the military and trade halting stages, and tracing the influence of trade and pilgrim routes

on Cholera. From Burhi I struck down to the Hazaribagh station, specially examining the village of Pudma and the town of Echack, which attracted my attention as having suffered severely from the late Cholera outbreak. Many sanitary defects were discovered during this enquiry, which might be briefly summed up as applying chiefly to (*a*) deficient and impure water-supply; (*b*) accumulation in, and non-removal of rubbish and cattle dung from within village limits; and (*c*) the carrying on of certain trades within villages' resulting in the discharge of decomposing organic matter which is not properly disposed of. Upon these points I made the following suggestions:—

(*a*) That it would be well to increase the supply of good water along the Grand Trunk Road in Manbhum and Hazaribagh, leaving the general question of district water-supply to be dealt with hereafter when the Local Self-Government Act comes into operation.

(*b*) That the strictest attention should be paid to the general cleansing of the chattis or halting stages.

(*c*) That special arrangements should be made for the water-supply, housing, conservancy, &c., of ryots who collect together for the weighment and delivery of opium.

(*d*) That similar arrangements be made for the pilgrims and others at Parisnath.

(*e*) That objectionable trades should be carried on outside halting places.

(*f*) That the south side of the Grand Trunk Road from Barakur to Burhi should be planted with trees.

(*g*) That the Maharani of Kassimbazar should be asked to instruct her manager to attend to the water-supply of the villages near the Barakur Railway Station, and that the East India Railway authorities should be requested to improve the condition of the tank at the Barakur Railway Station.

100. *Lohardugga and Singbhum.*—Although the mortality from Cholera in these districts was somewhat higher than during the preceding year and the lustrum 1880-84, it did not assume serious proportions, for it amounted to only ·47 and ·60 per 1,000 of population, respectively. The only circles in which noticeable mortality occurred were Chorea in Lohardugga—death-rate 4·82 per 1,000—and Chyebassa town in Singbhum—death-rate 7·99 per 1,000. In the former district, moreover, no deaths took place in thanas Torpa, Burway, Korambi, Palkot, Biru, Bassia, Chhuturpore, Barasara and Manikha. Eliminating Torpa, all the rest of these thanas enjoyed similar immunity in 1884. It appears that some villages in thanas Ranchi, Manda and Boondoo were severely attacked by Cholera from 5th July to 21st September. These villages were in an insanitary condition, but, according to the Magistrate, not more so than others which were not affected. In Singbhum some portions of thanas Chyebassa, Chuckerdhurpore, Anandpore, Kera, Seraikela and Kharsowan are said to have been epidemically visited by the disease. But I think the Cholera in Singbhum can hardly be called an epidemic visitation. A smart outbreak occurred in the Chyebassa town, commencing on the 16th March and terminating on the 6th April, during which there were 68 seizures and 42 deaths. The first cases occurred in the persons of two women who had come from Bamanghatty (where, however, it was not ascertained that cholera was present) to the part of the town called Madhubun on the 16th March. During the night of that day they were attacked. On the 20th March two of a company of musicians, living in the mussafirkhana (building for travellers), not far from the house where the women had put up, were attacked. Three cases then occurred in houses opposite the mussafirkhana; but the majority of the cases occurred in the neighbourhood of the house in which the two women resided. This Cholera occurred in the persons of outsiders, but cannot be said to have been introduced into the town.

101. *Manbhum.*—Here the mortality from Cholera was almost as low as in the preceding year, the death-rate reaching only 1·66 per 1,000 of the population against 1·74 per 1,000. Nevertheless the circles named in the margin returned noticeably severe

casualty rates. Para, Nirsha, Raghunathpur and Chass are thickly populated. Of noticeable local outbreaks of the disease the following may be cited. A smart outbreak occurred in the sudder station of Purulia in May and June during which 53 were attacked and 34 died. A few cases occurred in June and July among pilgrims on the Grand Trunk Road between Topchanchi and Nirsha. Another, a severe one, occurred in Jaipur in July, when 106 cases with 83 deaths were reported. Jaipur is a great thoroughfare and halting place of pilgrims, emigrating coolies and other travellers, and it is suspected that the disease was imported by some of them.

102. **Port of Calcutta.**—Of 23,573 *European seamen* who entered the Port during the year under review, only 16 were admitted into hospital for cholera and 7 died, or at the rate of 4·13 per 1,000 of the Port population estimated at 1,693. It will be seen from the figures given in the margin that in comparison with the preceding five years, the records of this year show a very considerable abatement both in the prevalence and fatality of the disease. This is a very gratifying fact.

1884	67	21·3

103. The marginal figures, taken from the report of the Health Officer of the Port, compare the mortality from Cholera in the Port with that which occurred in the country abutting it, viz., in Calcutta and its Suburbs and in the Howrah Municipality during the years 1880 to 1885. The comparison indicates that the Port death-rate approximates that of Calcutta throughout these years, excepting in 1885 when it was much less; but that it was considerably lower than those of the Suburbs of Calcutta and of the Howrah Municipality throughout the period under notice.

Comparative mortality in the Port and the Country abutting it.

104. Of the *Native Floating Population*, numbering 25,409, 59, or at the rate of 2·32 per 1,000, died from cholera. The number of deaths and the proportionate death-rates to population during the preceding five years are cited in the margin. From these figures it will be apparent that the above class of seamen also enjoyed great immunity from the disease in 1885 in contrast with its incidence during the period with which comparison is instituted, having suffered less than in any year of that period excepting 1880.

1884	138	5·43

SMALL-POX.

105. The returns of the Province for the year under review show, in comparison with similar information afforded by those of the preceding year, that 9,863 persons, against 18,533, died from Small-pox; that the proportionate death-rate to population was ·14, against ·28 per 1,000; that the malady affected with more or less severity only 18 circles against 53, and was absent from 272 against 224; and that it prevailed in 2·42 per cent. of the villages against 2·96 per cent. It is gratifying to find from this record that the prevalence and severity of the disease had abated very considerably in comparison with its incidence during 1884. Extending the comparison further, it is seen that the death-rolls of this year contain a smaller number (in some years considerably lesser) of casualties from Small-pox than has been recorded since the year 1876, eliminating 1877 and 1883, during which years the numbers were lower, *vide* marginal figures.

Extent of prevalence and fatality of Small-pox.

	Number of Deaths.		Number of Deaths.
1876	10,746	1880	22,953
1877	8,088	1881	24,371
1878	12,410	1882	13,651
1879	22,843	1883	9,714

106. The contributions to the total mortality of the year from Small-pox by the urban and rural circles of the Province are shown in the margin. The figures denote that both relatively and in comparison with the incidence of the disease in 1884, the suffering was greater in the urban circles than in the rural, the inference being that the latter circles may be better protected from the disease than the former.

Mortality from Small-pox in the Urban and Rural circles.

108. The experience of this year again indicates that small-pox is most prevalent during the hot months of March to June, for of the total deaths of the year, 6,276 occurred during these four months against 3,587 during the remaining eight months, the means of the preceding lustrum for these periods being 10,164 and 7,680, respectively.

Seasonal fatality of Small-pox.

Mortality from Small-pox among Infants and Children.

	Deaths.	Proportion per cent. to total mortality.

1 to 6 years	3,851	39·04
6 to 12 „	1,346	13·64
Total under 12 years ...	7,414	75·17

109. This information is furnished in the margin. The figures again demonstrate that the largest proportion of the mortality from Small-pox occurs among infants and children, as no less than 75·17 per cent. of the total mortality from this cause was borne by them.

Chief particulars relating to Small-pox in the Districts.

110. The interesting points connected with the incidence of Small-pox in the districts may be summed up as follows:

The steady decline of mortality from Small-pox in the *Midnapore* district, viz., from 591 deaths in 1878 to 137 during the year under review, is with reason stated to be due to the spread of vaccination. In *Howrah* the largest number of deaths from Small-pox occurred in the Jaggatbullubpore thana viz., 31 out of a total of 63, indicating that this thana needs more attention from the Vaccination Department. Small-pox is said to have been introduced into *City Murshidabad* by a boy 18 years old who had been vaccinated when he was two years of age and who had gone to, and returned from Calcutta. The disease broke out in him two days after his return, after which there occurred 52 cases in the quarter in which he lived. The Magistrate of *Dinajpur* writes: "Small-pox was almost wholly absent, and this fact is contemporaneous with extended operations of the Vaccination Department throughout the district." There were 8 deaths in this district, of which only one occurred in the town.

There was a small excess of mortality from small-pox in the *Rajshahye* district, but it is noticeable that the largest number of the deaths—21 out of 59—occurred in the Beauleah Municipality. It strikes me that this Municipality acts as a centre of infection of the district which is generally much better protected than the town. The Civil Surgeon of *Rungpore* examined 313 boys in the Rungpore school, of whom he found 207 vaccinated, 52 inoculated and 54 unprotected. This shows how much vaccination is neglected in the Rungpore town, and the necessity of introducing into it the Compulsory Vaccination Act. Only one death from small-pox was reported to have occurred in the whole of the *Darjiling* district. Dr. Ashe, the Civil Medical Officer of *Julpaiguri*, observes that in examining a reported case of small-pox, he found that, with the exception of from a dozen to a dozen and half of vesicles filled with a clear fluid which disappeared in three days' time, there were no other symptoms of the disease. He says that he had often noticed this vesicular appearance as a sequela of fever in this district; but I should observe that deaths from measles are often registered under the head of small-pox. During the first-half of the year 208 deaths occurred from small-pox in the *Dacca* town, and this mortality contrasted with that of previous years,* shows that the disease may be absent for years from a badly protected town and then reappear with a heavy mortality. Even in the *district* where the mortality stood at ·22 per 1,000 of population, the disease is too prevalent, indicating defective vaccination. In the *Faridpore* town there were only 5 cases of small-pox attended by 3 deaths, and all these cases occurred among an up-country Brahmin family living in one section of the town. They were not protected by either vaccination or inoculation and were strongly opposed to both measures; but they have since they were attacked by the disease recognised the utility of vaccination. The *Chittagong* town shared in the general immunity from small-pox which the Province enjoyed this year, but the Civil Surgeon says: "If it does get introduced, there can be no doubt but that the mortality will be large amongst the rising generation, who are almost unprotected. The adult population are, to a great extent, protected by inoculation or previous attacks of small-pox" He also apprehends that its unprotected state is likely to act very unfavourably on the prospects of its Port. There was, on the whole, considerably less small-pox in the *Patna* district; but it was present in every circle, and 421, or more than half the total deaths were recorded, 265 in Bikram, and 156 in Masouri. These thanas call for the attention of the Vaccination Department. A very sensible decrease of mortality from the disease occurred in the *Gya* district, viz., from 3,289 deaths in 1884 to only 819 this year, although this district is wholly unprotected by vaccination. On the other hand, the number of deaths in *Shahabad* was nearly double that of 1884, viz., 664 against 396, following, I suspect, increased activity in inoculation in opposition to Government vaccination. In the *Chumparun* district also there was a considerable increase of mortality from the disease, the deaths having risen from 1,733 in 1884 to 2,058 this year. In the *Sonthal Pergunnahs* district the Godda sub-division suffered rather severely. It is gratifying to find that there was less mortality from small-pox in the *Cuttack* district during this year than in recent years. The casualties amounted to 826, or at ·46 per 1,000 of population, against 3,179, or at 1·77 per 1,000, during the lustrum 1880-84. It was noticed that the protection afforded to Banpur thana in the *Puri* district in 1883 was followed by a sensible reduction in mortality from small-pox, for the deaths which amounted in that year to 526 fell to 94 in 1884 and to 3 in 1885, viz., 2 in January and 1 in March. Dr. Wood, the Deputy Sanitary Commissioner, Darjiling Circle, reports that in Hazaribagh 577 cases and 84 deaths from small-pox occurred. There was a great increase of mortality from the disease in the *Lohardugga* district, the death-rate having risen from ·09 per 1,000 of population in 1884 to ·21 per 1,000 this year, and the Palamow sub-division furnished the bulk of the mortality which according to Dr. Wood amounted to 148 deaths in 987 cases. This officer adds that thana Balumath in the same district had 114 cases and 14 deaths. The amount of small-pox in the two last named districts illustrates in the strongest manner how extremely imperfect protection by vaccination has been afforded to them. Only one death was recorded in the *Singhbum* district, and there was less mortality in *Manbhum* than since 1881.

FEVER.

111. This disease caused during the year under review the death of 1,042,142 persons, or at the rate of 15·75 per 1,000 of the population under registration in the Province. Marginally is tabulated the mortality from this cause in each year of the preceding decade.

Extent of prevalence and fatality of Fever.

	Deaths.	Ratio per mille.		Deaths.	Ratio per mille.
In 1875 ...	368,087	5·56	In 1880 ...	689,605	10·43
" 1876 ...	561,537	8·49	" 1881 ...	940,911	14·23
" 1877 ...	711,036	10·75	" 1882 ...	929,943	14·06
" 1878 ...	712,887	11·23	" 1883 ...	913,766	13·81
" 1879 ...	622,260	9·41	" 1884 ...	966,233	14·60

It attacked in 1885 63·73 per cent. of the villages against 64·78 in 1881, and was present in every circle, prevailing with great virulence in 24 of them against 29, with subdued activity in 154 against 116, and with normal severity in 469 against 504. These statistics indicate that, in comparison with its incidence in 1885, the disease was less extensively diffused but considerably more fatal, and that in no one year of the past decade, 1875-84, was the casualty rate so high as in the year under review. The steady advance in the death rolls, year by year, and the fact of a higher mortality occurring in a smaller area pervaded by the disease during this year bears out, in a great measure, my opinion that some portion of the numerical increase in the number of deaths recorded is due to improving registration.

112. The total mortality from fever was shared by the urban and rural circles in the Province in the proportions exhibited in the margin in contrast with the contributions of the preceding year. The figures again establish the fact that the rural circles are more prone to fever.

Comparative mortality from Fever in the Urban and Rural Circles.

	Deaths.		Ratio per mille.	
	1885.	1884.	1885.	1884.

Rural " ...	1,009,333	934,532	15·79	14·66

113. The figures under this head indicate that in seasonal fatality the disease followed the same course as it did in former years, viz., that it began to exhibit severity after the rains had well set in and was most virulent during the last quarter of the year, reaching culminating intensity in November.

Seasonal incidence of Fever.

114. The districts which experienced the severity of fever most during the year under notice are those named in the margin. Nuddea again heads the list, but it is gratifying to find that the fatality of the disease in it has subsided very considerably, viz. from the death-rate of 35·54 per 1,000 of population in 1881 when it prevailed epidemically, to 26·85 per 1,000 this year. It is also satisfactory to notice that Burdwan and Birbhum do not re-appear in this list of high suffering districts.

115. The principal statistics bearing on the incidence of fever in the Divisions of the Province and in Districts and such details of local outbreaks of the disease as appear to be interesting are subjoined.

General history of Fever in the Divisions of the Province and in Districts.

BENGAL.

116. In Bengal Proper 588,986 deaths were reported to have occurred from Fever in 67·82 per cent. of its villages, being in the proportion of 16·79 per 1,000 of its population estimated at 35,073,770, as opposed to 584,893 deaths in 70·42 per cent. of the villages, or at 16·67 per 1,000 in the preceding year, and to 553,964 deaths, or at 15·79 per 1,000, in the lustrum 1880-84. These figures denote that with a considerable reduction in extension of the disease,

Incidence of Fever in Bengal.

there was, in comparison with 1884, a small increase of mortality, amounting to ·12 per 1,000 of population, and, in relation to the lustrum 1880-84, a greater increase, viz. to the extent of one per 1,000. The fourth quarter of the year was, as usual, the unhealthiest, and, in accordance with the law of former years, there was more Fever in Bengal than in any other Division of the Province.

117. The marginal table presents the fever statistics of the six districts which compose the Burdwan Division of Bengal. They indicate that the disease prevailed over larger areas in Bankura, Midnapore, Hughli and Howrah, and over smaller ones in Burdwan and Birbhum; and that while the mortality was not excessive in any of the districts, it was greater in Hughli and Howrah in comparison with that which occurred during both the two periods mentioned in the table. With regard to seasonal prevalence of the disease the earlier months of the year exhibited variations in point of duration in each district, but its winter incidence extended in all the districts from September to December, except that in Burdwan it did not last beyond November.

Incidence of Fever in the Burdwan Division.

Districts.	Percentage of villages attacked in 1885.	Increase or decrease as compared with 1884.	Ratio of Deaths per mille.	Increase or decrease as compared with 1884.	Increase or decrease as compared with lustrum 1880-84.	Months of greatest prevalence.

Total ...	70·11	·15 *I*	14·79	·44 *D*	2·21 *D*	September to December.

118. *Burdwan.*—The improvement in fever prevalence which has been taking place in this district during recent years, continued most markedly this year. The mortality, amounting to 17·78 per 1,000 of population, was lower than that of 1884 by 1·03 per 1,000 and of the lustrum 1880-84 by 5·08 per 1,000; and only the six marginally-named circles out of 20 in the district presented noticeable mortality. If the registration is correct, this improvement in the health of the district generally is a congratulatory fact, considering that following the natural law, the population must be larger now than in former years, and that, consequently, the fever peculiar to this district, which was characterized by great fatality, should have furnished a larger number of deaths than has been recorded; but I fear that, the district forming no longer a special subject of attention and enquiry, the registration is also getting slack. It appears that in this district most parts of the thanas in the Sudder, Raniganj, Culna and Cutwa sub-divisions were inundated in August and September. The effect on health caused by this flooding is illustrated in the margin. On the whole it appears to have proved beneficial.

119. *Bankura.*—This district also enjoyed much immunity from the disease. Its recorded mortality amounted to only 12·35 per 1,000 of population and was lower than during 1884 and the quinquennium 1880-84 by 1·21 and 5 22 per 1,000, respectively. None of its circles returned notably high death-rates, but the mortality in the Kotalpur, Bissenpur and Indas thanas was higher than in the rest of the circles, viz. 17·75, 15·09 and 14·85 per 1,000 of population. The causes of the unhealthiness of Kotalpur and Bissenpur have been mentioned in my Report for the last year. The Assistant Surgeon in medical charge is of opinion that "the whole district may now be fairly considered as thoroughly included within the endemic area of malarious fever," and he observes that all the villages in the district outside the limits of the Bankura town "present a marked similarity in their insanitary conditions—flat

low-lying badly drained places, with a stiff soil extremely retentive of moisture, and decomposing marshes form the peculiar feature of the places;" that in the town of Bankura, where the natural drainage is excellent so that stagnant pools of water are scarcely seen and the ground moisture is at its lowest from the extreme porosity of the soil, there is scarcely any malaria worth the name and malarious cachexia is unknown; while in the district, even in places at the distance of a few miles from the town, fever prevails to an unusual extent and malarious cachexia is strongly marked.

120. *Birbhum.*—This district recorded a fever mortality of 16·25 per 1,000 of population, which, compared with 1884, presents a fall of 3·28 per 1,000 and with the lustrum 1880-84 of 6·35 per 1,000—in fact so low a death-rate was not experienced in the district during the last decade. It is hoped that "the decline will be steady and progressive so as to restore the district to its former reputation of a sanitarium." Notwithstanding this general immunity, there were circles in which the suffering was noticeably high. They are named in the margin. It will be noticed, however, that in all these circles, excepting Rampurhat, the casualty rates were considerably lower than in 1884. The Sakulipur thana is said to be one of the most unhealthy parts of the district, owing to its low position and somewhat water-logged condition during the rains.

Sakulipur „	15·94	19·19

The Civil Surgeon observes that the heavy rainfall of the year, particulary that of September, had, by scouring the surface of the ground, flushing all the cess-pools and washing away surface impurities, the effect of nipping in the bud the generation of malaria and of minimizing the prevalence of fever, and that from the some effects the inundated portions of the district enjoyed comparative immunity, notwithstanding the water-logged condition of the soil which helps to bring about the disease. He adds that he was struck with the clean appearance the villages he passed presented, and that instead of dirty shallow tanks over-grown with weed and vegetation, every tank was brimful of good clear water, the manure pits were washed out, and, in fact, the aspect of the villages was altogether changed.

121. *Midnapore.*—It was stated in the Report for 1884 that the incidence of fever in this district had been steadily declining for years past. This decadence was not disturbed in the present year, for during it the mortality stood at 14·53 per 1,000 of population against 14·79 in 1884 and 14·75 in the lustrum 1880-84. The circles which returned the highest casualty rates are noted in the margin. Referring to the great increase of mortality in the Panchura thana, amounting to 8·29 per 1,000 of population, Dr. Peck, the Civil Surgeon, says that it is due to a large area in this thana having been inundated; but in a subsequent portion of his report he observes that in the other inundated tracts there has been no large increase in deaths, and that the high suffering in this thana, as well as in the southern part of thana Tumlook, is referable to bad drainage and the decomposition of vegetation.

The Magistrate is opposed to the opinion of the Civil Surgeon with regard to the effect of the inundations. He says that the supply of pure water which the country received from the Siloi and Cossye rivers caused a mitigation of the usual malarious fever. The marginal statistics illustrate how far the inundation, which occurred in August and September, tended to increase or decrease mortality in the areas affected by it.

Sub-divisions.		Ratio per mille. October.	November.	December.

122. *Hughli.*—In this district the prevalence and fatality of fever were greater. The recorded mortality amounted to 15·74 per 1,000 of population, and this rate, although not excessive, was higher by 1·72 per 1,000 as compared with the returns of 1884 and by ·89 in comparison with those of the lustrum 1880-84.

The circles which returned the highest death-rates are indicated in the margin. The Civil Surgeon notes that the inundations in this district caused considerable increase of fever, and that this is not so apparent in the rural as in the urban tracts. This opinion is at variance with most others, and is, I fear, not given as the result of any careful enquiry. The urban tracts are those not generally flooded As the exact localities covered by the inundation have not been named, I am unable to test this opinion. The silted-up condition of the Sarasati and Kananuddi referred to in the last year's Report as well as of other channels came under the observation of Dr. ffrench-Mullen, the Officiating Deputy Sanitary Commissioner, Metropolitan Circles. He describes them as chains of stagnant pools, and states that "when the villagers are asked if the re-opening of them would benefit the people living along their banks, they answer in the affirmative, their faces becoming like that of a greedy child who is offered an orange," and he suggests that Government should urgently take up the question of the rapid decay of these and numberless other branch rivers. I am glad to note that Government has issued orders that the obstructions to the free flow of water in the channels of the Kananuddi and Sarasati should be removed by the canal officers, the local officers affording them every assistance, and that the villagers along these channels should be publicly informed that the erection of dams is illegal and will be punished according to law. Dr. Mullen, however, says that in thana Haripal the Kana river has been forced at its source within the last few years, and that since then there has been little malaria in the villages on its bank; while prior to the opening up of the river fever played great havoc in some, if not most, of these villages. This officer also visited a large number of villages in thana Jehanabad, and some in thana Goghat, and he notes that although there is very little jungle in the majority of them, and the water of the fields seems to have a free outflow into the river and certain khals, still nearly every child bears marks of blistering over the region of the spleen, while many have very large spleen, but they are free from fever this year. Both young and old look thin and poverty-stricken as a rule. They complain that this is the first year since 1880 or 1882 that their rice has not failed, and the rainfall has not been scanty, and they attribute their poverty to the drought of former years, and it is believed that the plentiful rains of this year has driven away the malaria. Dr. Mullen sees no other reason than that stated above for attributing their suffering so severely from malaria during the last few years.

123. *Howrah.*—In this district also fever prevailed more extensively and fatally than in the preceding year. The total mortality was 10·01 per 1,000 of population against 8·39 per1,000 in 1884 and 8·54 per 1,000 during the quinquennium 1880-84; but these low rates are, I fear, indicative of more than ordinary incompleteness in registration, for there is no reason to believe that this district suffers so much less from fever than the others in the Burdwan Division. The only noticeable observation made in the local reports is that fever declined during the rainy months of June, July, and August, and reached maximum fatality in October and November.

124. The statistics connected with the incidence of fever in the districts in the Presidency Division of Bengal are contained in the marginal table. They show that while, on the one hand, there was an increase in the prevalence of the disease in all the districts, excepting Murshidabad; on the other hand, there occurred a diminution of mortality in all, excepting 24-Pergunnahs, as compared with 1884, and Jessore as contrasted with the

Incidence of Fever in the Presidency Division of Bengal.

quinquennium 1880-84; that in relative mortality Nuddea and Jessore exhibited the highest rates; and that the months of greatest prevalence of the disease were generally October to December and January. The last-named month was, however, exempt from high mortality in Nuddea and Murshidabad.

125. 24-*Pergunnahs.*—The returns of this district exhibit a death-rate of 14·25 per 1,000 of its population, which rate exceeds that of 1884 by only ·09 per 1,000, but is lower than that of the lustrum 1880-84 by 1·66 per 1,000. The highest casualty rates were presented by the circles named in the margin. It is noticed as an important fact that the Bussirhat sub-division, which was the only tract which had been inundated, alone exhibited a death-rate lower than that of the preceding year, the other sub-divisions returning excesses; but it should be mentioned that the difference is not great—18·12 as opposed to 18·60 per 1,000 of population; that in this sub-division only one thana Baduria returned a noticeably lower death-rate, viz. 21·90 against 25·18 per 1,000; and that diminution in mortality was also a feature of the Baraset sub-division which presented a casualty rate of 19·23 against 20·21 per 1,000, although it was not inundated. But looking into the returns of the Bussirhat sub-division for the three months which followed the flood, it is seen that this year October exhibited a death-rate of 1·53 per 1,000 of population, November of 1·74 per 1,000 and December of 1·75 per 1,000 against 1·83, 2·62 and 2·60 per 1,000, respectively, in 1884. In general fever prevails in this district most during the first half of the rains, and attains maximum severity in the cold weather. The Chairman of the Baraset Municipality ascribes the increase of fever which occurred in it to exceptional rainfall, adding that the period from the month of Srabun (halves of July and August) to the month of Kartick (halves of October and November) is called the "Jomashtuck," that is when the eight doors of the god of death are open.

126. *Nuddea.*—In this district there was much extension of the disease, the area covered by it being represented by 88·96 per cent. of the villages against 86·26 in the preceding year. But it is very gratifying to find that the mortality had diminished considerably, the total casualty rate amounting to 26·85 per 1,000 of population, which is 2·37 per 1,000 lower than in 1884 and 7·28 per 1,000 than the mean of the lustrum 1880-84. Nuddea, however, still heads the list of fever-stricken districts this year. An examination of the mortuary statistics of the circles which compose the district individually shows that those named in the margin presented this year, the Nobodip town excepted, considerably lower death-rates than since 1880, when the fever began to be epidemic in the district; while the undermentioned circles exhibited no abatement as compared with either all the years under notice or with some of them. The figures for the years which show lower mortality are in antique type in this table :—

The figures in the above tables indicate (1) that while on the one hand the mortality had diminished during the year under review in *all* the circles of the Sudder sub-division, Nobodip town excepted, in comparison with the casualties in *all* the five years 1880-84 during which the fever prevailed epidemically, on the other hand the circles in the Kushtea sub-division exhibited enhanced mortality in comparison with the death-rates of one or more of the years above referred to, thanas Doulatpore, Bhaluka and Bhadulia showing exacerbations in comparison with the mortality in all the five years; (2) that in the Ranaghat sub-division four against two circles, in the Chuadanga sub-division two against three circles, and in the Meherpore sub-division also two against three circles exhibited improvement; and (3) that on the whole most part of the district may be said to have regained its normal health standard, excepting the circles where the registration is evidently defective, the health condition of which cannot, for this reason, be determined one way or the other. This improvement in health generally is ascribed to natural causes, the chief of which is the extensive inundation which occurred in August and September, submerging a large tract—1,000 square miles—in the district. It is said, however, that the great epidemic of 1880 was preceded by an inundation which occurred in 1879. The personal observations of Assistant Surgeon Preamber Mitter, Deputy Superintendent of Vaccination, Metropolitain Circles, go to show that the floods of the year had the effect of greatly warding off the fever in this district in comparison with its incidence during past years. I should add to the above causes the small improvements that have been effected in the district, particularly in connection with drainage. The inundation submerged the north of the Ranaghat sub-division and the whole of the other sub-divisions. I quote in the margin the fever mortality for the months of October, November and December in these sub-divisions during 1885 and 1884. The figures indicate that considerable reduction of mortality followed as a sequence to the inundations wholly in the Sudder and Ranaghat sub-divisions and partly in the others. The Civil Surgeon observes that "it is extremely satisfactory to find that the towns have now attained the standard of health they enjoyed during years prior to visitation of the epidemic." He ascribes this improvement to purer water-supply having been provided for, and to the higher standard of living which obtains in them. With reference to this observation, the Magistrate remarks that the registration in the former area being in the hands of the Municipalities is not so regularly done as in the rural areas, where the Police receive regular reports from the chowkidars. I am also of opinion that the registration in the urban circles is defective, particularly in the towns of Ranaghat, Santipore, Kushtea, and Meherpore, where the mortality from all causes was recorded at 8·63, 13·27, 24·90 (including 9·15 for cholera), and 16·92 per 1,000 of population, respectively. Moreover, the improvement in the towns must have been participated by their surrounding rural areas, and yet the latter have not returned such abnormally low death-rates. The Deputy Magistrate of the Chuadanga sub-division, who, the Magistrate states, "is an officer of great experience and whose remarks may be accepted with confidence," reports that the prevalence of fever in his sub-division appeared to be due to deficient water-supply compelling the people to use for drinking and domestic purposes filthy water, they being too poor to excavate tanks for themselves; to the drainage being bad; and to the dwellings, including even those of some of the zemindars and higher ranks of the people, being filthy in the extreme, abounding in jungle and noxious vegetation. He endeavoured in vain to induce the rich and well-to-do to take taccavi loans for the purpose of improving the water-supply in their respective villages, as they "decline to look forward beyond the four corners of their own dwellings in the sphere of their own interests;" and he advocates compulsory measures, without which he is of opinion that sickness and mortality cannot be minimised. The sub-divisional officer of Meherpore also quotes the same causes and deficiency of wholesome food as accounting for the prevalence of fever in his

sub-division which he says occurs biennially, once in the beginning of the cold weather when the floods subside, and again in the hot weather when the people are without wholesome water. He adds that this year the fever has been worse than usual (the statistics do not quite support this) owing to the weather having been exceptionally hot, and to a series of bad grain harvests having resulted in a diminished food-supply which rendered the people liable to succumb to disease. The sanitary condition of the Kishnaghur town is thus described: "It is an old overgrown straggling town, ill-arranged, and not lending itself readily to sanitary improvements. Its natural drainage has been interfered with by changes in the river-bed described in last year's Report; artificial drainage is still in an embryo stage; the soil is water-logged and riddled with ancient and existing privy shafts."

127. *Jessore.*—The mortality from fever in this district, although somewhat lower than in the preceding year, was still high, as it amounted to 21·44 per 1,000 of population; and the area occupied by the disease was greater, the excess being represented by 8·01 per cent. of villages Of the 22 circles in the district, so many as 18 returned exceptionally high death-rates (*vide* figures in the margin). It is to be regretted that the local officers have not been able to submit any explanation regarding the severe prevalence of the disease in this district. It is only said that "no disease could be traced to the floods." It appears that the whole of this district was inundated; the Bongong sub-division in August and September, the Magura sub-division in September, and the Jhenidah, Narail and Sudder sub-divisions in September and October. The fever mortality subsequent to the occurrence of the floods stands as indicated in the margin, contrasted with the death-rates of the corresponding period of 1884. The figures show a considerable reduction in mortality in all the sub-divisions excepting Jhenidah and Narail, indicating that on the whole the inundation did reduce much of the suffering. Dr. ffrench-Mullen, the Officiating Deputy Sanitary Commissioner, Metropolitan Circles, reports that in village Patabuk, thanna Gaighatta, people were still dying from the effects of the fever which prevailed in it a few years ago, and that in village Sripur, in the same thana, the people are still continuing to suffer from this fever.

128. *Khulna.*—In this area a considerably larger extent of country was overrun by the disease, the increase being represented by 15·12 per cent. of the villages; but the mortality, in addition to being somewhat lower than in 1884 and in the lustrum 1880-84, was not excessive amounting to 18·15 per 1,000 of population. The circles marginally cited presented the highest death-rates. It is stated that the head-quarters of the Sudder sub-division is the most unhealthly place in the district, and that here the Government officials and the Police Officers are the chief sufferers. Dr. Ghose, the Civil Surgeon, is of opinion that the great cause of fever in Khulna is stagnation of ground moisture. He writes: "Wherever fresh water flows freely and does not stagnate there fevers are rare; but show me *bhils* from which *khals* inefficiently discharge the water, and I will show you fevers and spleen disease throughout the year in the surrounding villages, and I would say *vice versâ.*" It was noticed that no outbreak of disease followed the inundation in the sub-division of Satkhira—the only area in Khulna which was submerged. The mortality in this sub-division, during the months of October, November and December, stood at 1·96, 2·23, and 2·07 per 1,000 of population, respectively,

against 1·74, 2·57, and 2·69 per 1,000 during the same months in 1884. These figures do not fully support the above statement.

129. *Murshidabad.*—Here both the prevalence and fatality of the disease had diminished to some extent in comparison with its incidence in 1884 and in the quinquennium 1880-84; but the mortality, which amounted to 19·56 per 1,000 of population, was still high. The areas of highest mortality, numbering 14 out of 27 in the district, are exhibited in the margin. It was observed that, although the fever prevailed with great severity, it was the effects of its *sequelæ*—enlarged spleen and liver, sloughing of the face, general dropsy, &c.—which caused most suffering to the poor, and that this was aggravated by their being compelled, owing to scarcity, to live on bad food. The Magistrate notes that after the inundation there was less fever prevalent than was expected; that village Khargram, in the thana of the same name, which has a notoriety for unhealthiness, was exempt from the malarious fever from which it had suffered severely last year; and that in fact the district was unusually healthy this year, the heavy floods, notwithstanding the hardships they entailed, having rather prevented than induced disease. The areas influenced by the inundation which occurred in the latter part of August, were the Jungipore, Lalbagh and Sudder sub-divisions. The comparative death-rates in these sub-divisions during October to December are given in the margin. These figures, on the whole, support the Magistrate's opinion.

130. The statistics of the Rajshahye Division of Bengal, presented in the margin, show that fever pervaded during the year under notice in larger tracts in four of its districts—Bogra, Pubna, Darjiling, and Julpaiguri—and smaller ones in three—Dinajpur, Rajshahye and Rungpore—in comparison with its incidence in the preceding year; and that while Pubna and Rajshahye returned very high death-rates and the returns furnished by Julpaiguri, Rungpore and Bogra do not indicate that they experienced a healthy year for fever, Darjiling and Dinajpur enjoyed much comparative immunity from the disease. The immunity of Dinajpur, however, is owing to defective registration. In comparison with 1884 all the districts, except Rajshahye and Pubna, exhibit increased death-rates, and in contrast with the lustrum 1880-84 all but Rajshahye an increase. In seasonal fatality there is seen much variation with regard to the months of greatest prevalence of the disease; but the winter months proved unhealthy in all the districts excepting in Darjiling, where the severity of the disease prevailed severely, contrary to its demeanour in the other districts, during July to September.

131. *Dinajpur*—In the Report for 1884 it was stated that the mortality from fever in this district had been steadily declining since 1878 when it stood at 21·41 per 1,000 of population; but this year the decline was not continued, for the death-rate amounted to 17·88 per 1,000 as opposed to 16·14 per 1,000 in 1884, and 17·28 per 1,000 during the quinquennium 1880-84. The casualty

rate of the year is not, however, conspicuously high. The circles which returned the highest death-rates are indicated in the margin. All these circles excepting Nawabganj, are lowlying tracts. There was no inundation of consequence, and the Magistrate notes that it appears to him that the abnormal rainfall of the year increased the mortality from fever, but the rainfall amounted to 62·08 inches against 61·32 inches, the average of preceding years.

132. *Rajshahye.*—In 1884 this district suffered pre-eminently in comparison with all the other districts in the Province. It is very gratifying to record that a very considerable diminution took place during this year in both the extension and fatality of the disease, as there was a decrease in the number of villages attacked to the extent of 14·82 per cent. of the total villages in the district and in the death-rate of 6·37 per 1,000 of population as compared with 1884 and 3·12 per 1,000 as contrasted with the lustrum 1880-84, the total casualty rate of the year amounting to 24·03 per 1,000. This mortality is, however, still high, and all the circles in the district, excepting Beauleah town and Panchpore thana, presented noticeably high death-rates (*vide* marginal figures). Dr. Cameron, the Civil Surgeon, observes that the prevalence of fever in the district this year was as great as during the past few years, as evidenced by the signs of malaria exhibited by the people, such as debility, watery blood, anæmia, enlargement of spleen, general dropsy, &c. The causes of its prevalence have been furnished in my Report for 1884 and need not, therefore, be recapitulated here. The reduction in the mortality is ascribed to the inundations. They occurred in July, continued through August and September and subsided in October, and submerged portions of thanas Beauleah, Singra and Panchpore, and the whole of thanas Charghat, Lalpore, Burigram, Putea and Tanor. These thanas are situated in the Sudder and Nattore sub-divisions, and an examination of the statistics of these sub-divisions yields the results given in the margin. They indicate a very considerable diminution of mortality during September, October, November and December of this year as compared with the casualty rates of the same months of 1884.

133. *Rungpore.*—In this district with a decrease in the extension of the disease was associated a very considerable increase of mortality. The death rate amounted to 22·72 per 1,000 of population, which exceeds that of 1884 by 5·63 per 1,000 and that of the lustrum 1880-84 by so much as 8·37 per 1,000; and all the circles in the district, excepting Dimla and Bhowaniganj, exhibited noticeably high mortality, as will appear from the marginally-cited figures. It was noticed that fresh cases of the disease were rare after October, and that very large numbers suffered from the usual sequelæ of the disease and relapses were common.

As the great unhealthiness of this district calls for notice, I am glad that the Civil Surgeon, Dr. Dutt, paid much attention to its circumstances so as to throw some light on its fever history. He visited Ulipore, Kaliganj and Mahiganj thanas which, as shown above, suffered very severely. "They," he says, "represent the depressed basins between the rivers and contain a number of small river tributaries, more or less choked by weedy growth and encroached upon by fishing weirs. The communication of these waterways with the *bhils*, which abound in these places, is considerably impeded and in some places obstructed. They remove the spill water from the *bhils* with

great difficulty during the rains. Jungle and rotting vegetation in stagnant pools abound in consequence." He also travelled in various parts of the district inspecting the dispensaries, and the following notes taken from his observations on the drainage and food-supply of the country may be found useful as indicating what might be done in these directions for this notoriously malarious district: "The natural drainage and the agricultural status of the district are," he says, "the principal features of sanitary importance. The district is a vast level of country drained principally by the Dhurla, Sankosh, and Teesta rivers. The tracts lying between the rivers and the principal tributaries, are depressions or basins, generally water-logged, where the greatest impediment to drainage occurs. Hence, there exists, following the lines of lowest levels, numerous water-courses expanding to *bhils*. The Kurotoya, Ghagat and Manas, tributaries of the Teesta, which used formerly to discharge the flood of the Teesta and drain the south-western portion of the district, are now so silted up and obstructed that they only take off the spill water of the bhils or marshes lying in their course. Embankments and fishing weirs and other artificial impediments are gradually reducing these streams and water-courses. As the drainage became gradually obstructed, in the same ratio the country became unhealthy; and this state of matters continues up to the present time." Dr. Dutt suggests as a remedy the re-opening of the existing water-courses and their preservation from artificial interference. Referring to the subject of food-supply, he writes: "There are great facilities for improving the agricultural status of Rungpore and much is being done in this direction. The soil is so fertile that it does not require much manure. It is humid and damp and requires no irrigation. It depends upon the rainfall for its supply of water, yet in a year of drought well irrigation is easy, cheap and sufficient. Still with all these advantages cereals are grown scantily, and *dals*, wheat and Indian corn, which will grow to any extent, are not cultivated although there is no lack of suitable land. Pasture lands are diminishing yearly, and, as a consequence, the breed of cattle is fast degenerating. Thus the defect in the food of the people is want of nitrogenous substances in the shape of cereals, milk, fish, flesh, &c., which calls for remedy."

The Rungpore town suffered severely from fever, and it was noticed that more than 50 per cent. of the inhabitants were attacked by the disease. The unhealthiness of this town is attributed by the Civil Surgeon to impeded drainage caused by the obstruction of the old bed of the Ghagat river and the new drainage canal, to interruption in the working of the surface drains by earthen dams made to serve as entrances to house premises, and to the insufficiency of the waterways which, he says, if not remedied in time, will aggravate the prevalence of fever year after year. He remarks, moreover, the prevailing winds which sweep over the bad *bhils* connected with the Alakuri and Manas rivers before reaching the town contribute, to some extent, to its unhealthiness; and very pointedly says that "in another place not enjoying the unenviable notoriety which Rungpore has attained for unhealthiness, there would have been, in spite of a large medical establishment, an outcry for preventive and medical measures." I am also impressed with the above views from what I saw during my inspection of this town this year. Its sanitation has been greatly neglected, grave defects existing almost under every head, so much so that, notwithstanding the great improvement in drainage which had done great good, the total death-rate rose from 28·15 per 1,000 of population in 1884 to 40·61 per 1,000 in 1885, fever taking a prominent part in causing this high mortality. The chief defects calling for early rectification will be found narrated on page liv, Appendix IV to this Report.

134. *Bogra.*—The death-rate from fever in this district was 21·21 per 1,000 of population, which rate exceeds that of the preceding year by ·25 per 1,000 and of the quinquennium 1880-84 by 2·37 per 1,000. Excepting Shariakandi and Adumdigi, all the other circles in the district presented high mortality (*vide* marginal figures). The sanitary reports do not furnish any account of the incidence of the disease in this district, excepting that the Civil Surgeon

observes that the fever prevailed most during the hot and winter months and least during the rains, and that the heavy mortality of the first quarter of the year was referable to the scanty rainfall of the preceding year.

135. *Pubna.*—In the Report for 1884 the Civil Surgeon remarked that the unhealthiness of this district, commencing from 1880, had reached culminating point in that year. The fever of the year under review, although less fatal, appears to have made a much further advance in the district, for the area invaded by it is represented by 73·21 per cent. of the villages against 68·60 per cent. while the death-rate stood at 25·63 per 1,000 of population against 27·45. But, this mortality compared with that of the lustrum 1880-84, shows a considerable increase, viz. of 8·46 per 1,000. As in 1884 so in this year, this district occupies the third place on the list of fever-stricken districts in the Province. In all its circles the fatality of the disease was conspicuously great, as will be seen from the marginal figures. In my Report for 1884 the causes of the unhealthiness of the district has been submitted, so I need not reproduce them here. In the Serájgunge town the disease prevailed very severely among the employés in the jute mills, prostrating 35 per cent. of them. The sanitary arrangements of this town are said to be most unsatisfactory. According to the Sub-divisional Officer the fever of the continued, remittent and intermittent types, which commenced in his Sub-division in 1883 and which had been gradually increasing since, assumed epidemic proportions from July of this year. But the death-rates of Raigunge, Shazadpore, Serajunge and Ulapara, which compose the sub-division, do not uphold this statement. The whole of this district, excepting its northern frontier, where Ulapara, the last in the above list, is situated, was inundated. The effect of the flooding, as judged by the marginal figures, was very beneficial, as the fever mortality appears to have been greatly reduced by it.

136. *Darjiling.*—Fever appears to have prevailed in this district much more extensively and fatally, as 3·50 per cent. additional villages were invaded by the disease, and the mortality was higher by 2·68 per 1,000 of population as compared with 1884, and by 5·55 per 1,000 as compared with the lustrum 1880-84. The total mortality stood at only 11·14 per 1,000, but this fact, and the fact that in only the Kurseong thana the death-rate was conspicuously high, amounting to 20·56 per 1,000, should not be accepted absolutely, as the registration in this district, although improving, is still very defective. The Deputy Commissioner notes that fever prevailed much in the Teesta and Runjeet valleys, in part of Pulbazar, in Guridhura and in Panighatta, these being the most unhealthy localities in the district.

137. *Julpaiguri.*—The records of this district for 1884 showed that both the prevalence and fatality of the disease had considerably increased in comparison with its incidence in 1883, but those of the year under review exhibit a further and greater enhancement. The percentage of villages in which the disease prevailed amounted to 90 against 79·57 in 1884 and 89·95 in 1883, and the death-rate was 23·71 per 1,000 of population as opposed to 18·25 in 1884 and 13·40 in 1883. The mortality of 1885 contrasted with that of the lustrum 1880-84 shows that an additional 9·43 per 1,000 of the population died. Excepting the Julpaiguri town, every circle in the district returned exceptional casualty rates, as will be apparent from the marginal figures. Dr. Ashe, the Civil Medical Officer, ascribes the prevalence of the fever to the water-logged condition of the district "in which malaria is endemic;" to local insanitary conditions; to the people living in crowds in ill-ventilated huts; to polluted water-supply; and to the prevailing climatic conditions, the ranges of temperature in

the 24 hours being very great. The mortality, he says, is great because the people are unwilling to seek medical assistance till their cases have become hopeless, as the fever in this district (of the usual malarious type) is easily amenable to treatment if taken early in hand; but if unattended to, it terminates fatally by asthenia; and, moreover, if the usual complications associated with it, such as dropsical effusions, dysentery, or diarrhœa, supervene, death quickly follows. He adds that the disease is low immediately before and diminishes in the height of the rains to increase and become virulent and highly fatal after their cessation.

138. The statistics of the Dacca Division of Bengal, marginally tabulated, indicate that, with a slightly enhanced prevalence of the disease in Backergunge, there was a decline in the other three districts, Dacca exhibiting a very sensible reduction; that the mortality was low in all the four districts; that in comparative fatality, lower death-rates were returned by Dacca, Faridpore and Backergunge, particularly by the last-named district, and a higher one by Mymensing in comparison with the fatality of the disease in 1884; but that in relation to the death-rates of the lustrum 1880-84 all four districts show an increase, Mymensing the largest; and that the months of greatest prevalence of the disease were generally January, April and October to December, excepting that in Backergunge March took the place of April and that in Mymensing the highest fatal results were limited to October, November and December.

139. *Dacca.*—The mortality from fever in this district reached only 12·86 per 1,000 of the population against 13·37 per 1,000 in the preceding year, and 12·41 per 1,000 in the quinquennium 1880-84, and only the Harirampore, Jaffergunge and Manickgunge thanas exhibited anything like noticeable suffering, the death-rates returned by them being 22·32, 20·29 and 16·52 per 1,000 against 25, 22·66 and 17·08 per 1,0C0 in 1884. Notwithstanding the great similarity in the mortality during this and the preceding year, the Civil Surgeon and also the Magistrate have no doubt that there was less fever this year, particularly in the malarious circles, such as the Manickgunge sub-division. Nevertheless, the thanas in this sub-division—Harirampore, Jaffergunge and Manickgunge—still head the list of fever-stricken areas in this district. The causes have been frequently explained in the reports of former years, and need not be recapitulated here.

140. *Faridpore.*—In this district also the prevalence and fatality of fever were low. The death-rate stood at 11·69 per 1,000 of population, being ·12 per 1,000 below that of 1884, and 2·13 per 1,000 that of the lustrum 1880-84, and only the Belakandi thana and Faridpore town presented high casualty rates—23·31 and 18·02 per 1,000 of population respectively. The Magistrate says that during the entire rainy season almost the whole of the Madaripore sub-division and thana Muksudpore in the sudder sub-division suffered a great deal from fever. This he ascribes to the heavy inundation; but the returns show that, in these areas as well as in the district generally, the cold weather months exhibited the greatest mortality, particularly December, and the Magistrate himself notes in another part of his report that owing to this cause the registration in the Bhanger thana was nearly stopped. The inundation above referred to by the Magistrate is evidently the submersion of the district which usually takes place during the rainy season, for the inundation which was common to Bengal occurred in September which, according to the Civil Surgeon, although not so great as in the neighbouring districts of Murshidabad, Nuddea and Jessore, rose unusually high. The exact areas which were flooded have

not been named, but there is no doubt from the account furnished that the whole of the Goalundo sub-division was affected. Taking this sub-division therefore as a typical area, it will be seen from the figures in the margin that the inundation proved, on the whole, beneficial to it.

		Ratio of deaths per *mille.*		
		October.	November.	December.
Goalundo ...	1885 ...	·97	1·69	1·98
	1884 ...	1·22	1·67	2·33

141. *Backergunge.*—Here, with an increase in the area pervaded by the disease, there was associated a decrease of mortality compared with the preceding year, but an increase contrasted with the quinquennium 1880-84. The figures are—percentage of villages affected 61·27 against 60·97 in the preceding year, and death-rate 14·37 per 1,000 of population against 15·46 per 1,000 in 1884, and 12·14 per 1,000 in the lustrum 1880-84. Only the Barisal, Medhigunge, and Gulachipa thanas returned high death-rates, viz. of 20·89, 20·01 and 18·86 per 1,000 of population. The fevers of this district are stated to be chiefly of the quotidian type, easily amenable to treatment, and not very fatal, enlargement of the spleen being rare.

142. *Mymensing.*—In this district the death-rate from fever amounted to 10·06 per 1,000 of population, the lowest of all the districts in the Dacca Division, but higher by 1·38 per 1,000 as compared with the mortality in the preceding year, and by 3·93 per 1,000 as contrasted with that in the lustrum 1880-84. The disease was, however, less extensively diffused, and the Civil Surgeon is of opinion that the increase in the death-rate is accounted for by improving registration rather than by increasing unhealthiness. In only two of the circles was the mortality noticeably high, viz., in Pingna thana and Attia town, which returned death-rates of 28·36 and 27·42 per 1,000 of population respectively. It is said that the great majority of the people in this district present malarial blue gum and enlargement of the spleen and that their physique is poor, the average weight of the men being only about 103lb.

143. The marginal figures, relating to the incidence of fever in the three districts—Chittagong, Noakhalli and Tipperah—in the Chittagong Division of Bengal, show that the disease prevailed less extensively but was more fatal in all of them than in both the preceding year and the quinquennium 1880—84; that it did not, however, exhibit excessive severity in any of them; that relatively Noakhalli returned the highest death-rate; and that, on the whole, the unhealthiest months were January and October to December.

Total ...	66·33	6·63 *D*	13·60	1·73 *I*	2·36 *I*	January, August, October to December.

144. *Chittagong, Noakhalli, Tipperah.*—The demeanour of the disease in all these districts was similar. Although the mortality was low, it was more severe during the year under review than during the years with which comparison is instituted in the above table. Chittagong returned a death-rate of 13·39 per 1,000 of population in 1885 against 10·37 per 1,000 in 1884 and 11·42 per 1,000 during the lustrum 1880-84; Noakhalli 16·42, 15·81 and 14·99; and Tipperah 12·23, 10·87 and 9·15 per 1,000, respectively, during the three periods above mentioned. In Tipperah the death-rate was not exceptionally high in any of its circles, and in Chittagong and Noakhalli only the few circles named in the margin furnished such rates.

Maskal thana ...	17·01	Chagulniah „ ...	19·39

The local reports received from *Chittagong* do not again furnish any information relating to the incidence of

the disease in it. Referring to the causation of fever in *Noakhalli*, the Civil Surgeon states that the disease becomes more general immediately after the cessation of the rains, and this is referred to sub-soil emanations arising from decomposed vegetation and other substances after the rains owing to the whole country having been more or less under water; that this unhealthiness not only continues during the drying up process, but is also kept up, though in a less degree, by the presence of sub-soil water even when the surface water has disappeared; that the other causes are that all the waterways in the interior of the district are silting up and drainage is obstructed for want of outlets; that in the north-west of the district there are large swamps; and that the water-supply is bad owing to the tanks falling low during the dry weather. A noticeable fact reported from *Tipperah* is that fever of a bad type broke out in the large village of Dhamti in thanna Moradabad, attacking 66 persons during September and October, but causing only one death. This village is situated amidst swamps and low ground; it abounds in jungle, and the drinking water is taken from tanks overgrown with weeds.

BEHAR.

145. In Behar 377,718 casualties from Fever were recorded during the year among its population estimated at 23,127,104, and in 64·98 per cent. of its villages, and the death-rate in relation to population was 16·33 per 1,000. In the preceding year there occurred 301,332 deaths in 62·55 per cent. of the villages, or at 13·02 per 1,000 of population, and during the lustrum 1880-84, 257,925 deaths, or at 11·15 per 1,000. This record demonstrates that both in extension of prevalence and fatality the disease exhibited considerable enhancement this year. There was again more fever and its fatality was greater in Behar than in any other Division in the Province, Bengal excepted. In seasonal incidence, the mortality was low in January and February, commenced to increase in March and prevailed at high, but varying, rates up to the end of the year, October and November being, in equal degree, the worst months. Almost the same features characterized the demeanour of the disease in 1884.

Incidence of Fever in the Behar Division of the Province.

146. The statistics illustrating the incidence of fever in the districts in the Bhagulpore or Eastern Division of Behar are presented in the margin. They denote that while in point of extension a larger number of villages were attacked by the disease in Sonthal Pergunnahs, Maldah and Purneah, and a smaller number in Monghyr and Bhagulpore, (in the order named,) in point of mortality all the five districts exhibited enhanced fatal results as compared with the death-rates of both the periods with which comparison is instituted in the marginal table; that in relative fatality Monghyr suffered in the greatest degree, Bhagulpore in the next, Sonthal Pergunnahs in the least, and Purneah and Maldah intermediately; and that in seasonal incidence the months of marked mortality were generally August to December, excepting that in Purneah and Maldah the disease prevailed much the same as it does in Lower Bengal, the principal feature being that the rainy months were the healthiest.

Incidence of Fever in the Bhagulpore (*East Behar*) Division.

DISTRICTS.	Percentage of villages attacked in 1885.	Increase or decrease as compared with 1884.	Ratio of deaths per *mille*.	Increase or decrease as compared with 1884.	Increase or decrease as compared with lustrum 1880—84.	Months of greatest prevalence.
Monghyr	75·75	16·37 *D*	25·65	12·24 *I*	14·78 *I*	March, August to December.
Bhagulpore ...	76·30	9·37 *D*	23·13	6·79 *I*	10·24 *I*	Ditto.
Purneah	97·14	·65 *I*	19·22	3·16 *I*	3·01 *I*	January, March, October to December.
Maldah	83·36	5·15 *I*	17·95	2·11 *I*	1·21 *I*	January, April, October to December.
Sonthal Pergunnahs.	69·96	12·49 *I*	13·22	·97 *I*	3·33 *I*	July to December.
Total ...	77·10	2·25 *I*	20·46	6·74 *I*	7·55 *I*	March, August to December.

147. *Monghyr.*—The great rise in the fever death-rate in this district, viz. from 13·41 per 1,000 of population in 1884 to 25·65 per 1,000 in this year is no

doubt due to better registration under the zealous and unremitting attention bestowed on the subject by Major Ramsay, the Superintendent of Police in this district, allusion to which has already been made in paragraph 8, page 3, of this Report. This improvement, it will be seen from the marginal figures, was shared by every circle in the district. No account has been furnished in the local reports relating to the prevalence of fever in this district, excepting that the Civil Surgeon states that the heavy mortality in thanas Monghyr and Shekpura is due to there being no drainage in these places, and to the low class of the people having used foul water; and that the Sub-divisional Officer of Shekpura adds, with reference to the high death-rate in the Shaikpura town, that it is very unhealthy, its drainage and sanitation being bad.

148. *Bhagulpore.*—In this district the casualties from fever amounted to 23·13 per 1,000 of population, and this rate exceeded that of the preceding year by 6·79 per 1,000 and of the lustrum 1880-84 by 10·24 per 1,000. Excepting Madehpur and Bongong, the rest of the circles in the district returned noticeably high death-rates, as per figures given in the margin. It is stated that Pertabganj and Bihipur are low and swampy and therefore subject to fever; and the Magistrate observes that the part of the country within the influence of the flood of the Kosi river, comprising thanas Pertabganj, Madehpur and Kissenganj suffers every year during the rains from fever. The monsoon commenced in June and ended in September. The death-rates in these thanas during 1884 and 1885 are exhibited in the margin. This record supports the statement of the Magistrate with regard to Pertabganj, except that October, November and December were also unhealthy months, but not to the same extent as May to September; but with regard to Mudehpurah and Kishenganj it is not in accord with the statistics for they show that October, November and December were the unhealthiest months.

149. *Purneah.*—The mortality from fever in this district, although greater than that of the preceding year and of the quinquennium 1880-84 by a little above 3 per 1,000 of population, was not excessive, as it amounted to 19·22 per 1,000. Nevertheless, the circles marginally named suffered severely. Nothing relating to the fever in this district, worthy of record, has been furnished in the local reports, excepting that the Civil Surgeon says that the effect of the inundations was to lessen fever. But this expression of opinion is not supported by the statistics given in the margin of the areas which were extensively inundated in this district during August and September, except to some extent with regard to thana Gondwara.

150. *Maldah.*—The incidence of the disease in this district during this year resulted in increase in both the area covered, and the mortality caused, by it—the increment in extension being represented by 5·15 per cent. of the villages, and that of fatality by 2·11 per 1,000 of population as compared with the preceding year. The death-rate, amounting to 17·95 per 1,000, was, however, low. Of the circles in the district, only thanas Gajol, Ratna and Kharba returned high death-rates, viz. of 22·84, 22·73 and 19·62 per 1,000 of population respectively. The Civil Medical Officer attributes the prevalence of the fever to humidity of atmosphere, caused by the retention of rain water in the numerous *bhils* and silted up river-beds with no outlets; and with reference to the winter prevalence and fatality of the disease he notes that the former was less owing to the inundation, and the latter higher owing to the greater number of the deaths having occurred from chronic fever associated with anœmia, dropsy and dysentery. The observations of the Officiating Deputy Sanitary Commissioner, Metropolitan Circles, in some villages in the Kharba thana which was inundated, confirm the first of the above statements, and the mortuary statistics of this thana, as well as of English Bazar and Maldah which were also involved, show that the mortality was higher during the months of October, November and December than during the other months, and much greater than during the corresponding months of the year 1884.

151. *Sonthal Pergunnahs.*—This district appears to have suffered the least of all the districts in the Bhagulpore Division. The mortality, although in excess of those of the preceding year and lustrum by ·97 and 3·33 per 1,000 of population, respectively, amounted to only 13·22 per 1,000. Beyond the following statements made by the Sub-divisional Officers of Rajmehal and Pakour, the reports of the year do not afford any information relative to fever prevalence worth recording. The Rajmehal Officer says that no unusual sickness was observed to follow the subsidence of the inundation in his Sub-division; but the Pakour Officer notes that during the floods no bad effect on health was perceptible, but that when the water began to subside fever commenced to increase. The inundation in these Sub-divisions occurred in August and September. The statistics furnished in the margin, if correct, support both statements.

152. The fever data of the districts in the Patna or Western division of Behar, marginally presented, indicate that relatively Gya suffered most from the disease and Sarun least, but all, excepting Gya and Shahabad, at a low rate; that in comparison with the figures of 1884, Gya and Sarun exhibited diminished, and the rest of the districts increased mortality; that in association with the mean results of the lustrum 1880-84 all the seven districts returned higher death-rates; and that the months of greatest prevalence of the disease were, throughout, August to December, excepting that its severity terminated one month earlier in Mozufferpore, Durbhanga and Sarun.

Incidence of Fever in the Patna (*West Behar*) Division.

Districts.		Percentage of villages attacked in 1885.	Increase or decrease as compared with 1884.	Ratio of deaths per *mille.*	Increase or decrease as compared with 1884.	Increase or decrease as compared with lustrum 1880-84.	Months of greatest prevalence.

153. *Patna.*—In this district fever caused the deaths of 16·47 per 1,000 of the population. This rate, although not excessive, was, however, in excess of those of preceding year and lustrum by 1·74 and 1·07 per 1,000, respectively. Only in three of the circles in the district, namely, Barrh town, and Dinapur and Sillao thanas the death-rates were exceptionally high, the rates being 32·31,

i

31·78 and 19·67 per 1,000 respectively. The local reports do not contain any noticeable account of the prevalence of the fever, excepting that, according to the Civil Surgeon, the unusually heavy inundation which occurred in August and September "caused an increase of fever in some parts of the districts." The inundated tracts lay in the Barrh and Behar sub-divisions, and the figures in the margin indicate the rates at which they suffered, which appear to bear out the Civil Surgeon's observation.

		Ratio per mille.		
		October.	November.	December.
Barrh	1885	2·03	2·34	1·09
	1884	1·34	1·82	1·24

	1884	1·25	1·17	1·05

154. *Gya.*—Here an extension of the disease was associated with a small decrease of mortality, viz. to the extent of ·10 per 1,000 of population as compared with the preceding year, the total casualty rate being 20·71 per 1,000. In comparison, however, with the mean results of the quinquennium 1880-84 the large increase of 6 deaths per 1,000 is seen. The areas of highest mortality are cited in the margin. The reports do not in this year also furnish any information relating to the incidence of the disease in the district.

Gya town	22·56		

155. *Shahabad.*—Fever prevailed very extensively in this district, much more extensively than in the preceding year, as deaths were reported from 95·41 per cent. of the villages against 75·47 per cent. in 1884. The mortality also was rather high, amounting to 19·72 per 1,000 of population, and the difference between this rate and those of 1884 and of the lustrum 1880-84, represented by increases of 6·84 and 8·52 per 1,000, respectively, was very great, indicating that the district has been deteriorating in health very considerably for some years. The areas of highest suffering are named in the margin. It is singular that amidst this great suffering the three towns of Domraon, Arrah and Buxar should return the lowest death rates viz. of 12·50, 9·52 and 7·41 per 1,000. The heaviest mortality of the year occurred in the 3rd and 4th quarters, *i.e.* during and after the rains. The Assistant Surgeon of Sasseram reports that the fever prevailed epidemically in his sub-division, there being not a single village in which the disease was not present, while in the town of Sasseram all the inmates of every house was affected by it, and that the fever was in nature and type exactly similar to the fever of Lower Bengal after the rainy season, attended in almost every case by the usual sequelæ. He attributes its prevalence to sub-soil humidity caused by the increased rainfall of the year, and to some extent by canal irrigation; but he adds that there are places situated at a considerable distance from the canals which were equally affected, so he concludes that the excessive rainfall was responsible for the fever of this year. Mr. Macpherson, the Joint-Magistrate, supplements the above by the statement that, it is an ascertained fact that the level of the sub-soil water has risen throughout the canal irrigated tracts, and that the canal embankments cause much obstruction to the drainage of the country. The Civil Surgeon has no doubt that the fever is, to a great extent, due to heavy rainfall, partly at unseasonable times, and to the unusually extensive and prolonged inundations. The Magistrate concurs in this opinion. The area which was chiefly affected by the inundation, which occurred during July, August and September, is comprised in the Arrah and Buxar sub-divisions, and the mortality in those sub-divisions during the months of October, November and December, given in the margin, endorses the above opinion.

		Ratio per mille.		
		October.	November.	December.
Arrah	1885	2·09	1·94	1·17
	1884	·98	1·04	·83
Buxar	1885	4·22	5·00	2·93
	1884	1·33	1·18	1·12

156. *Mozufferpore.*—Here, with a small diminution in the area pervaded by the disease, there was an enhancement of mortality to the extent of 2·15 per 1,000 of population as compared with the death-rate of 1884 and of 2·60 per

1,000 as contrasted with the mean result of the lustrum 1880-84; but the total casualty rate, amounting to 10·94 per 1,000 of population, was low. The only circles in which noticeable mortality occurred were the towns of Lalgunj and Mozufferpore, which presented the death-rates of 18·82 and 18·15 per 1,000 of population, respectively. The Civil Surgeon reports that fever, complicated with diarrhœa and cholera, prevailed in many parts of the district, and that this fever was not malignant in character, but that the great loss of life which attended it was chiefly due to the starvation system of treatment for its cure so popular among the natives of Behar. He also observes that there was no noticeable deterioration of the public health referable to the floods, and that, as mentioned in previous reports, he failed to trace any marked connection between inundation and out-breaks of malarial disease. The exact areas, excepting the town of Mozufferpore, have not been defined. In this town, however, the death-rates during October, November and December of this year amounted to 1·38, 1·66 and 1·75 per 1,000 of population, respectively, as opposed to 1·52, 1·33 and 1·35 per 1,000, respectively in 1884.

157. *Durbhanga.*—The behaviour of the disease in this district was the same as in Mozufferpore. The area attacked was somewhat smaller, but the mortality amounting to 12·20 per 1,000 of population, although low, was higher by 3·76 and 3·49 per 1,000, as compared with the rates of the previous year and lustrum, and no circle in the district can be said to have returned a noticeably high death-rate. Nothing worthy of record has been presented in the local reports excepting that the Civil Surgeon observes that the very heavy rainfall during the autumnal months enhanced the mortality.

158. *Sarun.*—Compared with all the districts in the Patna Division this district returned the lowest death-rate, viz. of 8·21 per 1,000 of population. This rate was lower than that of 1884 by ·84 per 1,000, but higher than that of the lustrum 1880-84 by 1·78 per 1,000. In this district also no circle presented noticeably high mortality. I think, however, that faulty registration has more to do with these low death-rates than the fever. Dr. Russell, the Civil Surgeon, observes that the effect of irrigation in this district "is to choke up the natural drainage lines and to induce malaria."

159. *Chumparun.*—The fever in this district, although more extensively and fatally prevalent, was not inordinately so in either respect. The death-rate amounted to 12·68 per 1,000 of population, as opposed to 12·54 and 8·27 per 1,000 during the previous year and lustrum. The behaviour of the disease was the same as reported last year. It attached itself with the highest fatal results to the two sub-Himalayan thanas of Louria (20·45 per 1,000) and Bagaha (17·49 per 1,000), and the greatest mortality occurred in November when the country was drying up; but it is to be observed that the next greatest mortality occurred in August when the rains were very heavy.

ORISSA.

Incidence of Fever in the Orissa Division of the Province.

160. In the Orissa Division of the Province, 24,394 persons, out of a population of 3,628,832, or at the rate of 6·72 per 1,000, died from fever in 43·98 per cent. of the villages, as opposed to 26,523 persons, or at 7·30 per 1,000 in 47·69 per cent. of the villages during the preceding year, and 25,805 persons, or at 7·11 per 1,000 during the quinquennium 1880-84. A comparison of these figures shows that the disease was somewhat less prevalent and fatal during the year under review. As usual Orissa suffered least from fever in comparison with the three other Divisions of the Province. The demeanour of the disease with regard to seasonal incidence was the same as in preceding years. It prevailed with some severity in January, maintained lower but almost uniform rates from February to September and culminated in intensity in November and December.

Incidence of Fever in the Districts in Orissa.

161. *Cuttack, Puri, Balasore.*—Of these districts, which comprise the Orissa Division of the Province, Cuttack suffered the most, Puri the least and Balasore intermediately; but in none of them was the mortality high. In all of them, moreover, the fever

attacked a smaller number of villages and caused a lower mortality in comparison with the incidence of the disease during the preceding year and lustrum, excepting that Cuttack returned a higher death-rate than in 1880-84. The months of greatest prevalence of the disease were November and December. The annexed table contains the statistics which illustrate these observations, and the circles in the three districts which presented the highest casualty rates are named in the margin. The other noticeable facts connected with the history of the disease in these districts furnished in the local reports are the following: In *Cuttack* the prevalent fever was intensified in the cyclone-stricken tracts on the coast from causes already described in paragraph 38 of this Report; but the suffering and privation were much ameliorated by supplies of food which were sent to all the distressed tracts, and by such other assistance as was within the power of the local authorities to bestow. In *Puri* it was noticed as a curious circumstance that during several years past as the fever mortality declined, the deaths under the head of "Other causes" have increased. The fever in this district is said to be most prevelent after the breaking up of the rains, and the villages on the Chilka Lake, in the Puri Sudder station, and the outposts of Champagarh and Ghintakapalli, are considered the unhealthiest places in the district. *Balasore.*—The opinion expressed in a former report that the Burdwan, Hughli and Midnapore fever had invaded this district through its northern thanas has been abandoned this year. The local reports indicate that the Jellasore and Baliapal thanas are popularly believed to be very malarial; that small tracts along the sea coast just where the rivers debouch upon the sea, are very feverish and notorious for unhealthiness, attributed to the rank vegetation and heavy deposits of silt at these places, but that where the coast is free from jungle it is healthy enough everywhere; and that thana Basudevpur, which suffered most from the influx of the storm-wave, exhibited a large increase of fever.

CHOTA NAGPORE.

162. The fever statistics of the Chota Nagpore Division of the Province indicate that 51,044 deaths were reported to have occurred from the disease in 55·98 per cent. of its villages, being at the rate of 11·77 per 1,000 of its population, numbering 4,334,178, as opposed to 53,485 deaths, or at 12·34 per 1,000 in 58·90 per cent. of the villages in the preceding year and to 50,397 deaths, or at 11·62 per 1,000 during the lustrum 1880-84. The comparison demostrates that the disease exhibited abated activity in comparison with the outcome of the preceding year, but somewhat greater severity in contrast with the results of the quinquennium above mentioned. Next to Orissa the suffering from fever was least in this Division of the Province. In seasonal incidence the months from January to July exhibited almost uniformly low death-rates; in August there was a rise, and this severity was maintained by the subsequent months up to the end of the year, November yielding the highest casualty rate This behaviour of the disease is not quite in accord with its usual incidence.

163. The marginal table, exhibiting the fever statistics of the four districts in the Chota Nagpore Division of the Province, present the following results—(1) That the area pervaded by the disease was smaller than in 1884 in all the districts, particularly in Lohardugga. (2) That Hazaribagh suffered the most, Lohardugga next, and Singbhum and Manbhum least in almost equal ratio. (3) That the death-rates were lower in all the districts than during both the periods mentioned in the table, excepting in Lohardugga as compared with 1884 and in Hazaribagh with the lustrum. (4) That the months of greatest prevalence of the disease were September to December in all the districts, excepting that in Lohardugga and Manbhum its severity was experienced one month earlier.

Incidence of Fever in the districts of Chota Nagpore.

164. *Hazaribagh, Lohardugga, Singbhum and Manbhum.*—It will be seen from the above table that of these districts the first named presented a death-rate of 15·52 per 1,000 of population, the second 11·70 per 1,000, the third 9·59 per 1,000, and the fourth 9·12 per 1,000. The areas which experienced the greatest suffering are those marginally named. Nothing of importance, referring to the incidence of fever in these districts, has been submitted in the local reports, excepting that in *Singbhum* the whole of its western portion, including Saranda Pir in thana Chukurdhurpur and Turuf Atkosi in thana Ghatsilla, have a notoriety for unhealthiness, fever being the dominating disease; and that in *Manbhum* the country about the Dalma Range in the south of the district is subject to fever and is generally unhealthy for persons not accustomed to its climate.

165. *Port of Calcutta.*—The figures in the marginal table show the extent to which fevers prevailed and proved fatal during the year under review among the 23,573 European seamen who entered the Port of Calcutta, the daily average number present being 1,693. They indicate that in comparison with the statistics of the preceding year enteric fever prevailed with considerably abated severity, the admissions into hospital being 4 against 7, and the death-rate ·59 against 2·96 per 1,000 of average strength, the quinquennial mean mortality being 1·91 per 1,000; and that while the admissions to hospital for malarious and simple fevers were larger, the mortality from the former cause was the same as in 1884, and no deaths occurred from the latter during both years.

166. Among the *Native Floating Population* 12 deaths against 5 in 1884 from malarious fever, or at the rate of ·47 against ·19 per 1,000 of the population estimated at 25,409, were reported to have occurred, and no deaths were returned as having been caused by simple fever against 10 in the preceding year. For reasons submitted in paragraph 33 of this Report these figures are unreliable, being incomplete.

Incidence of Fever among the Native Floating Population

BOWEL-COMPLAINTS.

167. Sixty-three thousand eight-hundred and eight casualties were reported to have occurred from Bowel-complaints during the year under review in 10·69 per cent. of the villages in the Province, or at the rate of ·96 per 1,000 of population, as opposed to

Extent of prevalence and fatality of Bowel-complaints.

58,376 deaths in 10·61 per cent. of the villages, or at ·88 per 1,000 in the preceding year, and to 55,401 deaths, or at ·83 per 1,000 during the lustrum 1880-84. In 20 against 13 of the registering circles in the Province maladies of this nature prevailed with noticeable severity, while they were absent from 20 against 21, and the remaining 607 circles against 615 exhibited no abnormal degree of suffering. This comparison indicates that while the diseases in question prevailed in an almost equal area they were more fatal. But I would attribute this increase in the number of deaths rather to improving registration than as expressing severity of prevalence of the diseases, for the recorded figures do not approach even an approximation to the actual prevalence and fatality of Bowel-complaints.

Comparative prevalence of Bowel-complaints in the Urban and Rural circles.

168. The urban circles contributed 9,382 deaths to the total casualties of the year, or at 4·12 per 1,000 of their population, and the rural circles 54,426, or at ·85 per 1,000 against 3·24 and ·79 per 1,000 respectively during the preceding year.

169. The marginal figures illustrate the seasonal incidence of bowel-complaints. The highest mortality occurred this year in August and September, while in 1884, November and December were the worst months.

Dysentery and Diarrhœa in Chittagong.

171. The Magistrate of Chittagong reports that an epidemic of dysentery and diarrhœa occurred among the coolies in the Futickcherry Tea Estate. During this outbreak 25 died from an average strength of 558 labourers. It was attributed to bad water from the Barromassi river which had been dammed up by the coolies owing to there being no wells in the garden, but the dam having been burst soon after by a flood, the water became muddy and filthy. The employers of the coolies have been requested to sink wells.

172. *Port of Calcutta.*—From the marginal figures it will be seen with regard to the *European Seamen* that, compared with 1884, dysentery prevailed among them with considerably greater severity, and that while the admissions into hospital for diarrhœa were less, no mortality occurred from it against a death-rate of 1·78 per 1,000 of population in the preceding year; and with respect to the *Native Floating Population* that while no

casualties from diarrhœa occurred among them, dysentery exhibited double the amount of the mortality of 1884; but the figures relating to the prevalence of the diseases among the latter class of the Port population are apparently unreliable.

INJURY.

173. The casualties from Injury amounted during the year under review to 28,956, or in the proportion of ·43 per 1,000 of population, in opposition to 24,674 deaths, or at ·37 per 1,000, in the preceding year and to 22,790 deaths, or at ·34 per 1,000, during the lustrum 1880-84. The comparison indicates an increase in the fatal results from this death cause, but nothing approaching to the actual mortality, if deaths from drowning and other accidents during the cyclone and storm-wave in Orissa and the inundation in a great portion of the Province could have been included under this head—the estimated number of lives lost in Cuttack alone amounting to about 15,000. To the recorded casualties of the year the urban circles contributed 1,147 deaths, or at ·50 per 1,000 of population, and the rural circles 27,809, or at ·43 per 1,000.

Mortality from Injury.

174. This information is furnished in the marginal table, contrasted with the similar information for the lustrum 1880-84. An examination of the figures in this table shows that the usual rule of snakes and wild beasts causing the greatest loss of life was departed from this year, the preponderance being conceded to accidents. This is no doubt due to some portion of the deaths from drowning, &c., during the storm-wave and inundations above referred to, having been recorded under the head of accidents. In other respects the observations of former years remained unchanged, suicides ranking third in the death roll, wounds exhibiting the least number of deaths, and the suicides of women preponderating.

Mortality from different Classes of Injury.

	Suicide.				Wounds.		Accident.		Snake bites and killed by wild beasts.	
	Deaths.			Ratio per cent. to Total Deaths from Injury.

In 1885 ...	1,040	1,783	2,823	9·74	1,627	5·61	13,325	46·01	11,181	38·61
,, 1880—84 ...	956	1,517	2,473	10·85	1,348	5·91	9,050	39·71	9,919	43·52

175. In consonance with the observations of former years, the greatest loss of life from violence occurred during the rainy months of June to September, for during this period 16,153 deaths were recorded against 12,803 during the other months. This mortality represents over 55 per cent. of the total casualties, and the reason for this preponderance arises, in great part, from the circumstance of reptiles being driven from their holes and wild beasts from their lairs by water and seeking refuge near the dwellings of men.

Seasonal incidence of Deaths from Violence.

176. *Port of Calcutta.*—The Health Officer reported that of the *European Seamen* nine met their death from drowning in the Port, being at the rate of 5·31 per 1,000 of average strength estimated at 1,693, against 12·47 per 1,000 during the preceding year.

Mortality from Accident in the Port of Calcutta.

OTHER CAUSES.

177. From diseases generally classed under the head of "Other Causes," in contradistinction to the specified diseases reported on in the foregoing portion of this Report, there were recorded during the year under review 186,209 deaths, or in the proportion of 2·81 per 1,000 of population, against 176,373, or at 2·66 per 1,000, during the preceding year, showing a small increase in the

Measles and Whooping cough in Darjiling.

178. In the town of Darjiling an epidemic of measles prevailed in March, April and May chiefly among the Europeans The outbreak was traced to importation, as the first case occurred in a boy in St. Paul's School who had returned from an infected house in Calcutta. The next sufferers were the boys in his class and the day pupils of the school carried the disease to two or three families in the station. Moreover, it was introduced into the Convent by two day scholars who took it from a Bhutia servant whose children had it. Whooping cough also prevailed severely and was also imported as it commenced in the Convent boys' schools through the medium of a boy who had shortly arrived from Calcutta with it. The malady was then carried by the affected boys to the Station.

EUROPEAN SEAMEN.

Mortality from Heat Apoplexy or sunstroke in the Port of Calcutta.

179. *Port of Calcutta.*—There was a great reduction in the number of admissions into hospital of *European Seamen* from sunstroke, but the mortality was much greater. The figures are :—number admitted 5 against 13 in the preceding year; deaths 3 against 1; and death-rate 1·77 against ·59 per 1,000 of average strength. This mortality was also much higher than the quinquennial mean rate which is ·98 per 1,000.

Mortality from Scurvy.

180. For this malady 13 *European seamen* were admitted into hospital against 24 in 1884, but none of the cases proved fatal, indicating great improvement under this head. The Health Officer reports, with reference to his observations in his Report for 1884 on the frequent occurrence of scurvy on board of vessels arriving from New York, that this year only four cases of the disease were found on board of vessels which arrived from that Port, and that the cause of the disease could not, in any instance, be attributed to improper food or neglect of rules. While on this subject, it should be mentioned that seven cases of scurvy were found on board a vessel from New York carrying a lascar crew. The enquiry held in this matter elicited the fact that while the men were well treated and had no complaint to make regarding their food in general, the vegetables supplied to them were not in accord with the articles of agreement entered into by them with respect to "vegetables dry at sea." The master of the vessel had interpreted the word "dry" to mean "preserved," and had issued preserved potatoes the antiscorbutic qualities of which are doubtful. This misunderstanding will, it is hoped, be prevented in future by the notification of the 6th June 1885 defining the meaning of the term "dry at sea." In addition to the above-mentioned deviation from the rules, it was found that lime-juice of two kinds (in about equal quantities) had been issued. "One being the fortified juice, issued from a bonded warehouse, the citric acid in which should have been 25 grains per fluid ounce. The Chemical Examiner reported that it contained only 21·12 grains. The other kind was a non-alcoholic lime-juice containing, according to the analysis of the Chemical Examiner, 29·08 grains. Both these specimens are suspicious—the first, by reason of its insufficient quantity of citric acid; the second, by its excess over the

Government standard 25 grains, suggesting sophistication. In addition to this supicion, the "non-alcoholic" is reported by the Chemical Examiner, to contain salicylic acid, that this is an unfortunate addition has been established, of late years, by the investigations of the highest sanitary authorities in France, who have refused to sanction the addition of salicylic acid, in any quantity, as a preservative of food either solid or liquid. They hold that the daily ingestion of the least quantity of salicylic acid by persons whose liver or kidneys are not sound (in which category many sailors may be placed) is dangerous."

Mortality from "Other diseases."

181. One thousand one hundred and seventy-nine *European Seamen* against 1,248 in 1884 were admitted into hospital for maladies classed under the head of "Other diseases," and of this number 21 against 26 died, the proportionate death-rate being 12·40 against 15·43 per 1,000 of average strength. These figures indicate that the incidence of the diseases was milder. The Health Officer states that the mortality from these diseases, consisting principally of phthisis and liver complications, might be attributed to climatic causes. He also observes that, as in 1884, so in this year, there was no evidence to show that venereal diseases among the *European Seamen* had increased since the abrogation of the Contagious Diseases Act, and he submits the marginal figures in support of this view of he question.

		Average strength of Seamen.	Total admissions of Venereal diseases cases into Howrah and General Hospitals.	Admission rate per 1,000 of average strength.
1883	...	1,860	257	127·4
1884	...	1,684	184	109·2
1885	...	1,693	170	100·4

NATIVE FLOATING POPULATION.

Mortality from Other Diseases.

182. The mortality among the *Native Floating Population* from the diseases classed under the head of "Other diseases," so far as it could be ascertained, was also lower. The casualties amounted to 25, or at ·98 per 1,000 of population against 37, or at 1·45 per 1,000 in the preceding year.

SECTION VII.

GENERAL HISTORY OF VACCINATION.

Year of Report.

183. THE history of vaccination considered in this section is for the official year 1885-86.

Officers in charge of the Vaccination Circles during the year.

184. *Calcutta.*—Surgeon-Major J. O'Brien from 1st April to 31st October 1885, and Surgeon-Major R. C. Sanders during the rest of the year.

Metropolitan Circles.—Dr. Kristo Dhone Ghose from 1st April to 20th May 1885. Surgeon-Major Kally Puddo Gupta returned from furlough and rejoined on the 21st May 1885, but having been deputed to special duty, he made over charge to Assistant Surgeon Jadub Chunder Ghose, Rai Bahadoor, the senior Deputy Superintendent, on the 20th November, who officiated till he was relieved on the 1st December by Surgeon J. ffrench Mullen who continued in office to the end of the year.

Darjiling Circle.—Surgeon-Major J. J. Wood throughout the year.

Ranchi Circle.—Surgeon W. Owen from 1st April to the 26th December 1885, and Surgeon L. A. Waddell from 27th December to the end of the year.

Sonthal Pergunnahs Circle.—Assistant Surgeon Kally Prosono Ghosal from 1st April to 10th August 1885, and Assistant Surgeon Kasi Nath Ghosh from 11th August to the end of the year.

Eastern Bengal Circle.—Apothecary A. Lyons throughout the year.

Behar Circle.—Assistant Surgeon Mothura Nath Sen throughout the year.

Orissa Circle.—Assistant Apothecary P. Veeriah Naidu throughout the year.

185. *Strength of Working Establishment.*

The changes of establishment in the Vaccination Department, as disclosed in the above table, are that, while on the one hand there was, on the whole,

an increase of one Inspector and 90 Licensed Vaccinators, on the other hand there was a decrease of one Deputy Superintendent, one Head Vaccinator, and 21 Vaccinators. These changes were made for the following reasons. In the *Suburbs of Calcutta* the three Head Vaccinators were done away with, and in their place three Inspectors entertained. The cause of the decrease of three Inspectors and two Vaccinators. and increase of one Head Vaccinator in the *Ranchi* Circle, has not been specifically furnished, probably the Inspectors were sent to the Political Estates and paid by the Estates, and the Head Vaccinator was entertained in the room of one of them, and the services of the Vaccinators were not required this year. There was a decrease of 17 Vaccinators in the Sonthal Pergunnahs Circle for which no explanation has been submitted. In the *Orissa* Circle two Inspectors were newly entertained to supervise the Licensed Vaccinators, who were appointed to carry on the Licensed System of vaccination, which was for the first time introduced into this circle. In the *Behar* Circle one Vaccinator died during the working season, and his appointment was not filled up. The cause of decrease of two Vaccinators in the *Ranchi* Circle and one in the *Darjiling* Circle has not been given. Their services were probably not required, or they had failed to return from leave granted to them during the recess. With reference to the increase or decrease of Licensed Vaccinators shown in the above table, it should be stated that their strength fluctuates according to the requirements of each year.

Employment of Female Vaccinators.

186. It should be mentioned that two female vaccinators were entertained during the year: one in Calcutta and the other in Joynuggur in the Metropolitan circles. The former was employed in visiting the zenanas of the respectable Hindu and Mahomedan inhabitants of the town, and in vaccinating and re-vaccinating grown-up females. The outturn of her work this year was not much, but as the people have come to know that there is a female vaccinator available, it is very probable that her services will be in greater demand during the current year. The female vaccinator of Joynuggur is said to be a fairly-educated person, possessing some knowledge of medicine, surgery, and midwifery picked up at the Calcutta Medical College which she attended to qualify herself as a native midwife. Something happening, she was obliged to give up her college career and take to private practice in Joynuggur, where Deputy Superintendent Jadub Chunder Ghose having met her, trained her in vaccination, after which she began to work as a municipal vaccinator in the town of Joynuggur. She is said to have given every satisfaction in the discharge of her duties, and the Superintendent of the Metropolitan circles intends to promote her at the earliest opportunity, and to employ her in the Suburbs of Calcutta, where her services will be of great use.

Conduct of Establishment.

187. A notice of those of the Vaccination establishment who are favourably mentioned in the reports and of those who were punished for grave misconduct, is subjoined. The conduct of the rest of the establishment, excluding also those who committed minor offences, was, on the whole, good.

Calcutta.—The encomiums bestowed on Assistant Surgeon Ram Chandra Mitter, Deputy Superintendent of Vaccination, in the Report for 1884-85 were repeated this year. He is reported, from his tact and knowledge of the manners and customs of the people, to be able to carry on vaccination with little friction and trouble among the varied populace of Calcutta. *Metropolitan Circles.*—Assistant Surgeon Jadub Chunder Ghose, Rai Bahadoor, Deputy Superintendent of Vaccination, is considered by the Officiating Superintendent to have displayed keen interest in his work, and to have promoted vaccination in his circle successfully. *Darjiling Circle.*—Inspector Hedayutullah and head vaccinator, M. N. Sircar, are reported as being diligent, sensible and intelligent. The latter officer was promoted to the post of Inspector this year. *Ranchi Circle.*—Government vaccinator Bechan Lall, Inspector of Licensed Vaccinators in Manbhum, was highly spoken of for good work rendered. It is gratifying to learn that, although still unsatisfactory, the conduct of the establishment of this circle was not so grossly bad as in former years, and that the worst delinquents having been dismissed, the present staff, although not altogether honest, are efficient vaccinators, and fairly amenable to discipline.

The following table gives the names of those who were guilty of flagrants misconduct, the nature of the offences, and the punishment which was awarded :—

Circle.	Names of officers.	Rank.	Punishment awarded.	CAUSE.
Ranchi ...	Nakhed Lall	Native Superintendent.	Fined	Extortion.
	Purmeshur Dyal	Vaccinator ..	Dismissed	Extortion and disobedience of orders.
	Nasib Lall	Ditto ...	Fined and dismissed .	Incompetency and doing no work for 10 days.
	Bhola and Haradhun .	Vaccinators ...	Fined	Overcharging fees and bad work.
	Araiya (Native Christian)	Vaccinator	License withdrawn ...	Drunkenness, quarrelling and assaulting villagers.
	Iltaf Hossein and Amir Ali	Vaccinators ...	Will be punished ...	Working in other than assigned area in defiance of orders.
	Name not furnished ...	Vaccinator ...	Fined	Taking pice from pregnant women and giving in return flowers, stating that if they are used in puja to "Sitala" the fœtus in utero would be protected against small-pox.
Sonthal Pergunnahs.	Woomesh Chandra Chandra.	Head vaccinator	Fined	Employing inoculators without knowledge and consent of Superintendent.
	Jogendro Nath Dutt Ram Taruck Bose .	Vaccinators ...	Dismissed . ..	Being implicated in a criminal case.
	Aughore Nath Sircar	Inspector ..	Under investigation ...	Obtaining a commission from the licensed vaccinators.
Behar ...	Nasind Dabee Singh ..	Head vaccinator ..	Fined, but case still under consideration.	Working in an area other than that assigned to him, and persisting to do so although fined.
Orissa .	Name not given ..	Vaccinator ...	Dismissed	Omitting to proceed to an area on emergent duty.
	Names not given	2 Vaccinators ..	Fined and suspended	Ditto ditto and disobedience of orders.
	Doityari Das ...	Clerk	Permitted to resign ...	Tampering with the account books.
	Brindabun Dass .. .	Inspector ..	Degraded	Inefficiency and neglect in supervising the licensed vaccinators, so that the scheme which was for the first time inaugurated suffered.

In the *Ranchi* Circle some of the vaccinators had taken rice from the Kols in Kolhan, but the latter said that it was customary with them to give rice, at least a handful, to Tokait Brahmins, and not to accept of vaccination gratis.

Areas vaccinated, and plans which determined the conduct of operations.

188. A summary of the information under this head is subjoined.

189. In *Calcutta* 12,365 operations were performed by 19 vaccinators, controlled by three Head Vaccinators, and supervised by the Superintendent, the Deputy Superintendent and Assistant Deputy Superintendent. As vaccination in this town is carried on under the provisions of the Compulsory Vaccination Act, further particulars as to the manner in which the work was conducted will be furnished in a subsequent paragraph of this Report, which deals with the mode in which that law was worked.

The subjoined table exhibits, in one view, the areas in *all* the circles in which vaccinations were carried on, the staff employed, and the amount of work which was produced during the year under notice, as compared with the results of the preceding year:—

* Operations performed by the Licensed Agency include Recess work.
† Includes Recess work.

The work performed in the several Circles, as exhibited in the above table, summed up, gives the results indicated in the marginal table. This table shows that, although the total number of areas in which operations were carried on, and the total number of operators employed this year, were larger than in the preceding year, there was a very considerable decrease in the number of operations performed, viz., of 114,496 contributed to by the Suburbs of Calcutta and the Ranchi, Sonthal Pegunnahs, Behar and Eastern Bengal Circles, notably by the last-named Circle; that the Metropolitan, Darjiling and Orissa Circles, with additional vaccinators of 38, 10 and 12, respectively, produced excess work represented respectively by 7,208, 23,002, and 10,710 vaccinations; and that 78,274 operations were performed in areas that had not formed the scene of operations during the preceding year.

190. In the *Metropolitan Circles* arrangements for starting the season's work were made in September, and as the plan on which the operations were carried on was the same as in the preceding year (details of which have been furnished in paragraph 183 of my report for 1884-85), it need not be repeated here. The only difference was that, while during the preceding year some of the thanas were not taken up, this year none were excepted. The work of the *Suburbs of Calcutta* includes 3,574 vaccinations performed in the cooly depôts. Further particulars as to the mode and plan followed here will be found described in a subsequent paragraph of this Report, as they were governed by the provisions of the Compulsory Vaccination Act.

191. In the *Darjiling Circle* the field of work taken up by the Government and licensed vaccinators was the same as that of the preceding year.

192. In the *Ranchi Circle* operations were commenced from the 25th of September, but this early starting of the work was attended by an unusual amount of sickness among the staff, and the sickness was much greater than that which prevailed in the preceding year. About one-third of the men caught malarious fever and were incapacitated from active work during half the season; some of them are still seriously ill, and one of the vaccinators died. The area of work was in jungle tracts, which are notorious for unhealthiness all the year round, but especially in September and October. To the licensed vaccinators were assigned the Hazaribagh and Manbhum districts, the southern portion of Lohardugga, the Singbhum district, excluding the Kolhan and Dhalbhum, and the Political Estates of Surguja, Udaipur, Korea, Jashpur and Gangpur. Hazaribagh has been taken up for three successive seasons by the Licensed vaccinators. Generally in Hazaribagh and in the other districts those portions in which operations were not carried on in 1884-85, or which escaped vaccination in previous years, were taken in hand this year.

193. The Superintendent of the *Sonthal Pergunnahs Circle* says that certain thanas in Bhagulpore and Monghyr were selected for operations this year, because vaccination had either not been introduced into them or were performed before in a very imperfect and perfunctory manner. The former assertion does not appear to be correct, but the latter I regret to say is. I note, moreover, that during even the present season operations were not conducted in the way which had been directed by this office. The Officiating Superintendent, however, was new to the work. He shows that the number of children born in the districts of Monghyr and Bhagulpore is very considerably more than can be vaccinated by his present staff, and he therefore proposes to place the latter district under the Licensed agency system, and to concentrate his staff in completely protecting Monghyr.

194. In the *Eastern Bengal Circle* the district of Noakhalli, one thana in Dacca, six in Backergunge, and two in Tipperah were taken up by the Government agency, and the districts of Noakhalli, Dacca, Faridpore, Mymensing, Tipperah and three thanas in Backergunge were attended to by the Licensed Agency.

195. In the *Behar Circle* the thanas of Bhabuah, Mohaneah, Kargher, Dehri, and Sasseram in Shahabad were newly taken up; the whole of the Patna district was assigned to the Licensed Vaccinators, and 327 operations were performed by the Government staff in the Municipalities of Patna and Jugdispore. It is noted that the licensed vaccinators did not begin work early in the season, because they cannot realise their fees before the harvesting of the paddy crop, the people being mostly of the agricultural class.

196. In the *Orissa Circle* the licensed vaccination scheme was for the first time introduced, and operations under it were carried on from 1st January 1886 in thanas Jajpore and Dhurmsala in Cuttack, the vaccinators having been previously trained to the work for three months, during which they received a subsistance allowance of Rs. 4 each per mensem. The Nursingpur Tributary State was also taken up for the first time, and work at Bhudruck in Balasore was undertaken at the request of the Deputy Magistrate, in order to suppress an outbreak of small-pox.

Plans which determined the conduct of operations in the *Municipalities*.

197. Vaccination was conducted during the year under review in 43 sudder Municipalities, 86 outlying Towns, 4 Cantonments, and 24 Dispensaries. With a few exceptions in which the surrounding villages were taken up, the operations were performed within the limits of these Institutions. In addition, vaccination was extended to the following persons, viz., to the prisoners in the eight jails named in the margin, the operations being performed by the Medical Officers in charge of them; to the employés in the Northern Bengal State Railway stations at Saidpore, Sara, Hilli, Silliguri, Kownea, Parbuttipore, Badergunge, Rungpore, Jatrapore, Julpaiguri, and Huldibari, and to others who resorted to these stations by a licensed vaccinator entertained by the Railway authorities; to the boys in the Mymensing zillah school, Hardinge school and Mymensing institution, by the Civil Surgeon; to the employés in the Chandpur and Dodalia Tea Estates in Chittagong at the cost of their Managers; to the people in the Dhankanal Tributary Mehal in Cuttack at the cost of the Estate; to the people in the Ullapore pergunnah within a radius of 10 miles, and in Narail in Durbhunga, at the cost of the Durbhanga Raj; and to the people in Hatwa, Bhori and Gopalgunge and in the surrounding villages at the cost of the Hatwa Raj. The table in the margin shows the number of operations which were performed in the above-named Institutions and places. Of the operators, 20 were licensed vaccinators. Many of the Sudder Municipalities were divided into sections, and vaccination carried on in one section methodically and exhaustively before another was taken up. In the outlying Municipalities operations were carried on, on the whole, desultorily without any regard to system. The great drawbacks to municipal vaccination are that, with few exceptions, the staff of operators employed is not commensurate with the area required to be protected, and that almost everywhere the vaccinators are engaged for only the vaccinating season; in some municipalities for only three, two, or one month. The following facts connected with municipal vaccination deserve mention. The vaccinator in *Sherpur* in Mymensing was not paid a single pice during the whole season he was at work, and the consequence was that vaccination suffered in this town. A plan was followed in the *Jalpaiguri town* of making the vaccinator submit an account of his work daily, and of publicly informing the people that they have nothing to pay for having themselves and their children vaccinated. In the town of *Dumka*, as there was no vaccinator employed, the unprotected persons, with their guardians if they were children, were, once a

week, brought to the dispensary by the town chowkidars and vaccinated by the Civil Hospital Assistant after a list of the unprotected had been made out. The Medical Officer of the Serajgunge town advocates the introduction into it of the Compulsory Registration Act, as without a record of births and of deaths of children it is difficult to find out the unprotected children. In the *Nasirabad* Municipality in Mymensing vaccinations were performed in a desultory way, the subjects being those who volunteered to be vaccinated, or unprotected children seen in the streets and followed to their homes and there vaccinated, together with such of their neighbours as were within reach. The operators were the Dresser and Compounder of the Dispensary, and as they were paid one rupee for every 10 operations, and had their other duties to perform, better work could not be expected. This plan will not be reverted to next season. In the *Jamalpore* Municipality in the same district the Civil Hospital Assistant was allowed Rs. 10 for every 100 vaccinations performed by him, but this Officer would rather that the Municipality employ a regular vaccinator, when it would get more work than he can give with his other duties, the Municipality being a very extensive one. In the *Cox's Bazar* Municipality in Chittagong vaccination proved an utter failure, chiefly owing to the Assistant Surgeon not carrying out in time the orders he received to make an attempt to introduce vaccination. He was not provided with an establishment, but the work could have been carried on in the dispensary. In the *Faridpore* Municipality a Licensed Vaccinator was employed, but most of the people exhibited unwillingness to pay for his services. As the people pay Municipal taxes, the Municipality should employ a paid vaccinator. The Civil Surgeon of *Chumparun* observes that vaccination will continue to remain in an unsatisfactory footing in the towns in Chumparun, unless the Compulsory Vaccination Act is introduced. He adds that the Municipal Committees have a certain sum at their disposal for sanitary works, and that it cannot be better employed than in securing efficient vaccination.

No vaccination was carried on in the Satkhira, and Chanduria Municipalities in Khulna; in Netrokona in Mymensing; and in Bhowara in Chumparun.

Degree of Protection *afforded* in the Vaccination Circles.

198. *Calcutta.*—The Superintendent says that the amount of protection afforded to this town cannot be stated definitely, as it depends on the nature of the population, for reasons explained in the last year's report; but vaccination was carried on with great vigour in every quarter of the town throughout the year, no ward being left untouched.

199. *Metropolitan Circles.*—From a statement furnished by the Superintendent it appears (1) that the thanas marginally named have been fully protected; (2) that the whole of the thanas in the 24-Pergunnahs and Jessore districts have been nearly fully protected, excepting 1,110 families in 10 villages in thanas Bagarpara, Mamudpur, Kalia and Lohagura in the latter district; (3) that, eliminating the thanas marginally cited, the rest of the thanas in the Nuddea, Murshidabad and Howrah districts have also been nearly fully protected, excepting that in Nuddea 350 families in six villages in thanas Karimpur and Damurhuda, in Murshidabad 541 families in 13 villages in thanas Gorabazar, Gowas, and Shamsherganj, and in Howrah 773 families in 22 villages in thanas Jagutbullubpur, Amta, Bagnan, and Shampur are altogether unprotected, and that in Murshidabad thanas Dewanserai, Gokurnu, Kallyanganj, Mirzapur, Khargram, and Kandy have been partially protected; (4) that similarly all the thanas in Burdwan, Khulna, Bankura, and Hughli have been nearly protected, with the exception that in Burdwan thanas Culna, Ganguria, and Selimabad, and in Bankura thanas Bishenpur, Gungajulghati, Bankura, Onda, and Sonamukhi have been partially protected; and that in Khulna 570 families in 8 villages in thanas Bagirhat, Mollahat,

FULLY PROTECTED.

and Morelganj; and in Hughli 802 families in 12 villages in thanas Dhonakhalli, Bolagur, Panduah, Haripal and Chunditolla are entirely unprotected; and (5) that in Midnapur and Birbhum all the thanas, excepting Gurbetta in the former, which is entirely unprotected, and Ramporehat in the latter, which has been nearly fully protected, have been only partially protected. Moreover, in Midnapur so many as 12,400 persons in 820 villages in 15 of the thanas are altogether unprotected. It thus appears that the whole of Nuddea has been best protected, and 24-Pergunnahs, Jessore, Murshidabad, Hughli, Khulna, and Burdwan in the next degree; and that Midnapore, Birbhum, and Howrah have been most backward, notably Midnapore.

200. *Suburbs of Calcutta.*—From the following statement made by the Superintendent, it would appear that the Suburban Municipality has been nearly thoroughly protected. He says that comparatively a very small number of children are unprotected, as during his inspection of the *bustis* he could not find a single unvaccinated child, excepting a few who were not permanent residents. But according to an estimate made by him it would appear that out of the 5,853 births reported during the year, vaccination had not reached 1,951 children, and these children, excepting such as had died, it is evident must have been removed from jurisdiction by their parents or guardians upon receipt of notices calling upon them to have them vaccinated.

201. The Superintendent of the *Darjiling Circle* says that thorough protection of an area in the Darjiling district is temporary, because immigration of unprotected individuals is constant, but in the whole circle there is no area which is left untouched. He reverts to the question of an exhaustive vaccine census of a defined area as a means of ascertaining the amount of protection afforded, which however, in my opinion, can be sufficiently accurately known from the census population of villages and the records of vaccination. The taking of a census for this purpose would be a useless waste of time and money.

202. The report of the Superintendent of the *Ranchi Circle* states that no thana has been thoroughly protected, but that the whole circle has been partially protected, excepting a few isolated villages, such as Dandila and Gadwana in thana Patan, and six small hamlets in the remote east of perguna Tari in Lohardugga; and that protection in the Palamow sub-division in Lohardugga is the most advanced. But from the report of the Deputy Superintendent, it appears that the Tundwa thana in Manbhum and small portions of the thanas named in the margin in the same district and in Singbhum have been thoroughly protected, and that the remainder of the above-named districts and the whole of the districts of Hazaribagh and Lohardugga, with the undernoted exceptions, have been partially protected. The areas not yet protected are said to be two or three villages in thana Chuckurdhurpur and in the Kolhan in the district of Singbhum, and some villages in Hazaribagh and Lohardugga. But on this statement the Superintendent remarks that under the purely persuasive system at present in force in carrying out vaccination, the adult portion of the population do not, as a rule, accept vaccination, and consequently a considerable portion of them not having had small-pox, as well as several children in the areas said to be thoroughly protected, have escaped vaccination. From personal inspection in the Manbhum and Hazaribagh districts during the working season, I was convinced that the amount of protection given in these districts is very partial and insufficient.

203. *Sonthal Pergunnahs Circle.*—No portion of the circle has, it is said, been thoroughly protected. Operations have been carried on in every thana in the circle, and those named in the margin may be said to be almost thoroughly protected, while the remaining thanas have been partially protected. Thanas Shaikpura, Teghra, and the outpost of Borhye in Monghyr, and several villages in the Rajmehal sub-division, which had been hitherto untouched were taken up this year.

204. The report from the *Behar Circle* is to the effect that the Arrah, Belowti, Dumraon, Peroo, Buxar and Dhangain thanas, and the Nokha outpost in Kargher, Nusriganj outpost in Dehri, and Novi outpost in Mohania in the Shahabad district, and the Patna district have been fairly protected; that the remaining thanas in Shahabad have been partially protected; and that the areas not yet touched are Chumparun and the districts of Durbhunga, Mozufferpur, Sarun and Gya. Thus in 11 years not one district or part of a district has been thoroughly protected from small-pox. This shows that the establishment, as at present constituted, cannot overcome the difficulties of introducing vaccination into Behar.

205. The Superintendent of the *Orissa Circle* reports that only the Jajpur and Dharmsala thanas in Cuttack, which had been made over to Licensed Vaccinators this year, appear to have been thoroughly protected, new-born children and adult females being excepted; that the localities named in the margin have not yet been vaccinated; and that the remainder of the circle, including the areas taken up this year, have been partially protected. This statement indicates that too large an area was taken up this year, and that none of it was thoroughly vaccinated, the result of the vaccinators not having worked near enough together.

206. Under this head I have only to mention that to the list of Municipalities and Towns thoroughly protected and fairly well protected, furnished in paragraph 202 of my report for 1884-85, may be added for the year under review, the Chaibassa Municipality under the former category, and the Khulna Municipality under the latter, and that vaccination has so far progressed in the towns of Bhuddressur, Khirpai, Bogra, Jalpaiguri, Purulia, and Patna as to entitle them to be classed as fairly well-protected areas.

Degree of protection in the Municipal area.

207. As usual, humanised lymph was obtained from all the circles, and, in addition, bovine lymph from the Metropolitan circles, and distributed by this office to the Municipalities, Dispensaries, &c., in the Province. The demands of private parties and from many localities out of the jurisdiction of Bengal were also attended to. In the *Metropolitan circles* only bovine and in the *Ranchi* circle only humanized lymph was employed. In *Calcutta* and in all the other *Vaccination Circles*, and in a large number of the *Municipalities* and *Towns* both classes of lymph were used. In *Calcutta* bovine lymph taken from 120 vaccinated calves sent from the Suburban Central Depôt to four of the vaccine stations principally was extensively employed, and the demand for this virus in private houses had also greatly increased. Thus 2,625 persons were vaccinated, after which the operations, numbering 9,740, were continued by the arm-to-arm process. In the *Metropolitan circles* lymph taken directly from calves was distributed in tubes to the Inspectors for the establishment of virus in their respective circles. The first supplies invariably failed, and a second and in some cases a third supply had to be sent before the virus was established. One thousand three hundred and thirty-nine persons were vaccinated direct from the calf. When the virus was once established, it was kept up by arm-to-arm vaccination. In all 245 calves were vaccinated: 39 for the suburban depôts, 120 for the Calcutta depôts, and 86 for lymph to be stored in tubes. Five thousand two hundred and ten tubes of lymph were supplied to my office for distribution, and 5,474 despatched to different parts of the country on the requisition of public officers and private parties. In the Suburbs of Calcutta humanized lymph was employed during the recess. In Midnapore and Bankura great difficulty is felt in maintaining arm-to-arm vaccination owing to the objection of the people to part with the virus from the arms of their children, the general belief being that the children will sicken and die if this is done. For this reason also, and owing to outbreaks of cholera causing the death of the vaccinifers when they were procurable, great difficulty was experienced in the *Darjiling* Circle in keeping up the lymph supply in the plains. In the *Orissa Circle*, two calves and some persons were vaccinated with bovine lymph sent from this office, and from the vesicles which appeared, arm-to-arm vaccination was carried on. The lymph from the calves was also stored

Source and character of Lymph employed during the year.

in tubes and distributed to the vaccinators for carrying on operations in their respective areas.

Crusts were used in the Darjiling and Chittagong towns, as objections were made to part with lymph from the arms of children. For the same reason lymph in glasses and tubes was used in some cases in the *Behâr* Circle. Many of the vaccinators in the *Ranchi* Circle used crusts for no assigned reason. In the Goalundo Municipality arm-to-arm vaccination was not permitted, but virus was preserved in tubes for vaccination. The result, it is said, was a large rate of success.

Number of operations performed with *Bovine Lymph*, with results.

208. The non-success of operations with Bovine Lymph in tubes was very general this year, but the failure occurred mainly in the Municipalities, and in them the instances were many where the first supply having failed, further trials were abandoned. Favourable and adverse opinions with regard to the value of the virus were, as usual, recorded, the former predominating this year, and the causes of the failures mentioned in my former reports were again repeated. But these non-successes do not, I submit, militate against the scheme if we bear in mind the large success that has always attended the trials made with this virus in Calcutta and in the Metropolitan and Sonthal Pergunnahs Circles. It appears to me that repeated and extended trials and greater care in storing the virus are required. An important fact, which the experience of this year disclosed, should also be taken advantage of, viz., that bovine lymph stored and used after the cold weather has well set in generally succeeds. I think, moreover, that, in order to attain thorough success, it would be a wise plan to have calves vaccinated locally in all the vaccination circles. The attendant expenditure cannot be great; the existing establishment can do the work; the expense will be only for calves and contingencies, once for all for establishming a lymph supply. A good plan for all places easy of access to Calcutta by rail or water is that which was adopted in the Serampur Municipality, which is to send a child or two to Calcutta to be vaccinated direct from the calf; and with the virus thus obtained to carry on arm-to-arm vaccination.

During the year I received a communication from Dr. Waddell, sending me an extract from the *London Medical Record* containing observations on the use of certain antiseptics for preserving vaccine lymph. I forwarded the papers to Dr. Gupta, requesting him to give a trial to the suggestions made in them, as I thought that anything done in this direction might prove useful, and that at least some experiments on the use of tubes first sterilised by heat and then washed in a weak solution of corrosive sublimate were well worthy of trial. It appears that some experiments were made by this Officer, but I have not been favoured with the results, nor are they to be found among the records of the Metropolitan Circle Office. However, in the interests of vaccination, I think it useful to record below the extract above referred to, with Dr. Waddell's observations thereon:—" Dr. Richard Pott, who is demonstrator of childern's diseases at Halle, gives a valuable contribution to our knowledge of this subject (*Archiv fur kinder heilkunde, Band, IV, Heft II*). The antiseptics used were carbolic acid, salicylic acid, borax, and thymol; and the solutions were in all cases mixed with the lymph in equal proportions, and either employed directly or sealed in tubes, and reserved for subsequent experiment. The vaccination was always primary and the lymph always humanized. In nearly all cases, each arm was vaccinated in five places. Fresh carbolised lymph (*i.e.*, that under four weeks old) gave the following results. Mixed with a 1 per cent. solution of carbolic acid, it was successful seven times out of eight; with 2 per cent. solution, only once tried, and successfully; 3 per cent. tried sixteen times, successfully in all; with 4 per cent., successful eleven times out of nineteen; 5 per cent., tried six times, and always failed. The admixture of the last solution produced a cloudiness in the lymph owing, perhaps, to coagulation of the albumen. By longer contact with the antiseptic, the lymph appeared to lose its power. Experiments with carbolised lymph, from 6 to 12 months old, gave the following results. A 1 per cent. solution was successful only five times out of eleven. Two per cent., 3 per cent., and 4 per cent. solutions were tried respectively four times, twice, and once without a single successful result. The course of the vaccinia which was produced by fresh carbolised lymph was carefully watched, and was found to differ in no respect from that

of ordinary vaccinia. *Salicylic acid* was used in one-third per cent. solution; and, when fresh, the lymph was successful in fifteen out of seventeen cases, but when from six to twelve months old it was useless. *Borax* in $3\frac{1}{2}$ per cent. solution was employed fresh in thirteen cases, all of which were successful; and the stale mixture was effectual in seven out of eleven cases. The author considers, therefore, that a solution of borax is the best means of diluting lymph when the quantity is limited. One child, however, vaccinated with this admixture, developed on the ninth day a roseola extending all over the body and limbs, and accompanied by slight fever. At the end of three days it had disappeared. *Thymol* (strength not given) was mixed with lymph and used fresh in thirty-eight cases, of which all but two were successful. The author followed up the cases, and from daily observations convinced himself that the vaccinia thus produced followed its typical course. For further researches with this antiseptic, he refers to the experiments of Stern. In conclusion, the author says that aseptic lymph of proper strength and freshness has the advantage of being more fluid and of going twice as far as ordinary lymph."

Dr. Waddell remarks:—" Although recommending the use of aseptic lymph, Dr. Pott does not consider that it really *preserves* the lymph so as to allow of its being kept for a very much longer time. The very latest observations on the action of antiseptics on bacteria are *à priori* against the practicability of preserving lymph against ordinary putrefactive decomposition by means of aseptic agents, such as bichloride of mercury, &c., which are very much more powerful and certain in their action than carbolic acid or borax. These recent observations show that pathogenic bacteria—even so resistent ones as anthrax-bacilli—are very much more readily killed by aseptic agents than ordinary putrefactive bacteria are. So that to ensure the killing off of all putrefactive bacteria, so large a quantity of the disinfectant must be added that the specific activity of the pathogemic fluid must be destroyed. In the operation of taking up lymph from a vaccine vesicle, ordinary putrefactive bacteria must, in practice, gain entry into the fluid—falling into it from the air as the lymph is being exuded, or derived from the inside of tube or clinging to point of tube, or from the cuticle over the vesicle. In ordinary practice it is quite impossible to obtain lymph which is devoid altogether of putrefactive germs. The only way to guard against decomposition would be to use sterilised capillary tubes, and introduce these directly into well-formed vesicles (thus losing a very large amount of material), and even in this case the total absence of putrefactive germs would not necessarily be assured, for in many cases they have already made their way into the vesicle."

Dr. ffrench Mullen thinks that stained tubes might prevent any injurious action which light may have on the lymph.

The subjoined table shows the number of vaccinations performed with bovine lymph during the year, and the results. It includes the figures of those Municipalities where proper trial was accorded to the scheme:—

Description of virus.	Circles.	Number of areas.	Total number vaccinated.	Primary.		Revaccination.		Percentage of successful cases to total vaccinated with bovine lymph.

	Grand Total of both	241	464,110	459,127	455,286	4,983	2,036	99·16	40·85

The above figures indicate chiefly that of 3,304 primary operations with lymph taken direct from the calf, 91·73 per cent. proved successful; that of 3,273 operations in which tube lymph was employed, 84·66 per cent. were successes, the Municipalities yielding 84·82 successes and the Sonthal Pergunnahs exhibiting the highest rate, viz., 95·91 per cent.; that by the arm-to-arm transmission of the lymph, of 452,550 primary cases, 99·32 per cent. proved successful, the Municipalities showing 95·18 successes and the Metropolitan and Sonthal Pergunnahs Circles giving the best result; and that the total results of the year by all three processes are represented by 459,127 operations attended by 455,286 successes, or at the rate of 99·16 per cent. In re-vaccinations the varying successes are on a par with those attained by the employment of humanized lymph. I submit that this record indicates that the results realized by vaccinating direct from the calf and by the arm-to-arm process are very satisfactory, and that those obtained by the employment of lymph stored in tubes are, on the whole, fair.

Local opinions on the value of Bovine Lymph.

209. The following is a resumé of the opinions on the subject submitted by the local officers who employed bovine lymph during the year in conducting vaccinations. To avoid lengthening the report I have selected for notice only the well-defined, positive and important observations:—

Calcutta.—Dr. Sanders notes that while at times the vesicles were very typical and almost identical with those obtained from humanized lymph, the instances were not few in which they were small with many failed points, and ran an irregular course; and that in a great many cases there occurred failures. There were failures also after the second operation, and humanized lymyh had to be used. This the Superintendent says is to be greatly regretted; the animal virus is not only safer and more convenient, but it is also greatly preferred by the intelligent classes, both Native and European. Nevertheless, the above table shows that when it did take, the success was satisfactory, for the primary operations gave 91·44 per cent. of successes, and the re-vaccinations 16·36 per cent.

Metropolitan Circles.—The Officiating Superintendent observes that failure in one or two points in operations with bovine lymph was more frequent this year. This he attributes to the incisions having been made in the transverse instead of in the usual vertical direction of the arm; but he notes that when the case is thoroughly successful, the vesicles produced seemed to look more natural and altogether more healthy than equally successful cases in which humanized lymph had been used.

Sonthal Pergunnahs.— The Superintendent of this circle watched the cases personally in their different stages of growth and development, as also the cicatrices after the falling off of the scab, and he pronounces the character and quality of the vesicles to be quite typical and satisfactory; and he is of opinion that fresh bovine lymph acts in a similar manner to good humanized virus, but that the operations performed with the former are attended with a greater degree of constitutional and local irritation manifested by stronger fever and more fully developed areola. It was noticed that all the operations in the Colgong, Shahebganj, and Deoghur towns proved successful.

The Superintendent of the *Behar* Circle states that when the lymph was clear and transparent in the tubes it proved successful, and that in all the cases the

fever was high and the vesicles typical. He is of opinion that clear bovine lymph in tubes is superior to humanized lymph in tubes.

Orissa Circle.—The operations with bovine lymph were more extensively performed in this circle during this than during the preceding year. Mr. Naidu, the Superintendent, says that he has examined most of the operations, and that in every case he found the vesicles more characteristic and typical than those obtained by humanized lymph.

Dr. Barker, the Civil Medical Officer of *Scrampore*, perceived no difference between the manifestations of bovine and human lymph. He thinks the former is more likely to be pure and free from contamination. Dr. Russell, the Civil Surgeon of *Nuddea*, continues to hold to his opinion expressed in his last report, which is briefly, that bovine lymph requires to be used direct from the vesicles of the calf if satisfactory and certain results are to be obtained. But a remarkable point in this year's experiments is that two children, who had been vaccinated with bovine lymph in tubes, but on each arm of whom only a single, partial, delayed vesicle arose, on being afterwards re-vaccinated by the arm-to-arm process, had each four good vesicles which ran a regular course and attained an ordinary development, which led Dr. Russell to the conclusion that no protection was apparently conferred by the single imperfect vesicle. Dr. Hendley, Medical Officer, Northern Bengal State Railway, reports that, so far as his experience extends, it leads him to believe that bovine lymph is successful in more cases than humanized lymph, and that comparing the successful cases with both kinds, no difference could be seen. This year with 30 tubes of the latter not one case succeeded, so that crusts had to be resorted to, but with 40 tubes of the former, 18 gave successes. The Assistant Surgeon of *Madhubani*, in Durbhunga, considers, so far as he can judge, that bovine lymph is as potent and effective as humanized lymph. The vesicles "assume a more threatening appearance, the fever is greater in severity, and the lympathetic glands in the majority of cases are very much swollen and inflamed. These circumstances may seem to show that the system is more affected, and consequently more protected when vaccinated with bovine lymph than with the other kind of lymph." The success which attended the operations with bovine lymph this year has induced Dr. Dutt, the Civil Surgeon of Rungpore, to alter his hitherto unfavourable opinion with regard to it, seeing that the percentage of successful cases was 89·10 by bovine lymph against 86·88 by humanized lymph. He believes the lymph of this year was of better quality and more carefully stored, and he says that "such bovine lymph as I received during the year under review may well hold to its own against humanized lymph, if it is not indeed superior to it." In the *Comillah* and *Durbhunga* Municipalities, and in the Naraya Dispensary in Durbhunga, all the operations with bovine lymph in tubes proved successful. The Civil Hospital Assistant of the last-named institution says that from his long experience he is satisfied that bovine lymph is better than humanized lymph.

210. From the marginal table, exhibiting the work of the year, it will be seen that the aggregate number of operations performed, amounting to 1,368,996, was less than those of the preceding year by 119,300; that to this reduction both the Vaccination Circles and the Municipalities contributed—the former, where the operations numbered 1,284,174, to the extent of 118,086; and the latter, where 84,822 vaccinations were performed, to the extent of only 1,214; and that the work of the circles

individually considered indicate improvement on the side of the Darjiling, Orissa and Metropolitan Circles, and retrogression on that of the Eastern Bengal, Ranchi, Sonthal Pergunnahs and Behar Circles, the Suburbs of Calcutta and Calcutta in the order named.

The diminution of work was attributed to the following causes:— In *Calcutta* (1) to paucity of subjects, house-to-house enquiry having shown that there was a great reduction in comparison with the preceding year of unprotected infants and children; and (2) to smaller number of operations in the Port, it being remembered that the Native Floating Population is a fluctuating one and always on the move. In the *Suburbs of Calcutta.* (1) To the efficient manner in which the Compulsory Vaccination Act was worked under the superintendence of Dr. Ghose in 1884-85. This curious statement involves the fact that the Enactment in question was worked less efficiently this year; but it should be added that efficiency was certainly maintained with regard to the vaccination of children under one year, for here an increase of 852 operations is seen. (2) To vaccinations in the central vaccine depôt having been except in very rare cases, stopped. (3) To the Calcutta Corporation and the Suburban Municipality performing operations through their own establishment from vaccinated calves supplied them, while in the preceding year the people resorted to the vaccine depôts to be vaccinated. (4) To there having been a lesser number of coolies at the depôts for emigration, the number being always a fluctuating one. *Ranchi Circle.*—In Lohardugga and Hazaribagh, to a smaller number of operators employed this year; to insufficient supervision for want of more inspecting vaccinators; to paucity of unprotected children, particularly in the Palamow Sub-division, where the vaccinators not unfrequently found only one or two unvaccinated children in each village, often none; and, most of all, to the early closing of work, to allow of the early submission of the Annual Report within the prescribed period. In Singbhum, to reduction in the number of operators from 19 to 13, and to the serious illness of half this number compelling them to abandon work about the middle of the season. In the Kolhan to the vaccinators working under great disadvantages and hardship owing to their not getting their pay monthly, as the police, who used hitherto to disburse it to them, having refused to do so this year; to dearth of water at times; in some places even salt and mustard oil not being procurable. With regard to the plea of paucity of children, I should say that my observations in Hazaribagh impressed me with the belief that the protection afforded to the district was very defective. In the *Behar Circle* (1) to unusual prevalence of fever in Shahabad during September, October and November retarding work; (2) to most of the vaccinators having suffered from fever, some so badly as to take sick leave, of whom 1 died; and (3) to opposition to vaccination in the thanas in Shahabad newly taken up, the resistance going to the length in some cases of assaulting the vaccinators. In the *Eastern Bengal Circle* to various causes, chiefly (1) to an inoculator having worked in Dhakin Shabazpur year by year, so that when vaccinators were deputed to it this year, they found only infants and children unprotected, whom the people were exceedingly averse to get vaccinated from fear of evil results; (2) to the areas taken up being thinly populated; and (3) to having to contend against vigorous opposition by the Ferazis, who muster strong in the areas in Noakhali which were taken up. But these causes insufficiently account for the large decrease of work, represented by 111,047 operations, which took place. The causes of decrease of work in the *Sonthal Pergunnahs Circle* have not been furnished.

Recess work.

211. During the recess 12,523 operations were performed in almost all the thanas in the *Metropolitan Circles;* 6,122 in the *Suburbs of Calcutta;* 4,873 in the Rajshahye, Dinajpur, Rungpore and Maldah districts in the Darjiling Circle; 2,540 in some thanas in the Hazaribagh, Lohardugga and Manbhum districts in the *Ranchi Circle;* 10,312 in some villages in the Bhagulpore, Monghyr and Sonthal Pergunnahs districts in the *Sonthal Pergunnahs Circle;* 12,411 in the Noakhali, Dacca, Faridpore, Pubna, Mymensing, Tipperah, and Backerganj districts in the *Eastern Bengal Circle;* and 1,878 in some thanas in Shahabad and Patna in the *Behar Circle.* No such operations were reported from the *Orissa Circle.* This work was performed to maintain lymph and to stamp out outbreaks of small-pox.

212. In this year 801 Municipalities returned reduced work against 63 which exhibited improvement. The causes accounting for the diminution are many, but the chief of them are inefficiency and laziness of the operators and insufficient and perfunctory supervision. Lateness in establishing virus to commence the year's operations, owing to failures of the early supplies of lymph both bovine and humanized, particularly the former, no doubt precluded a larger number of vaccinations being performed.

Increase or decrease of Vaccinations in Municipalities.

Number of Primary and Secondary operations, and rates of success under both heads.

213. This information is furnished in the subjoined table:—

CIRCLES.	PRIMARY.						SECONDARY.						INCREASE OR DECREASE IN PERCENTAGE OF SUCCESSFUL CASES IN 1885-86.

From the above figures it is seen that there was a decrease in the number of primary vaccinations amounting to 113,721 operations, which was borne by the Vaccination Circles to the extent of 112,631 operations, [the bulk (111,104) of the diminished number being contributed by the Eastern Bengal Circle] and by the Municipal Area to the extent of 1,090 operations. In re-vaccinations there was a total diminution of 5,579 operations, most of which (3,874) having occurred in the Suburbs of Calcutta. Increase or decrease in this class of operations is dependent in a great measure on the presence or otherwise of Small-pox. The figures representing the percentages of success which attended the primary operations indicate that, with small variations in comparision with the figures of the preceding year, approved rates of success were returned. The cause of depreciation in primary successes in Calcutta is said to be due to the results of a very large number of the station vaccinations not having been ascertained. There is no explanation from the Suburbs of Calcutta. The rates of success in re-vaccinations seen in the above table point to the suspicion that the cases were not re-vaccinations; and indeed the Superintendents of the Metropolitan and Ranchi Circles, where these ratios were exceptionally large, support this view of the matter; for the former says that the operations were performed on persons who had been unsuccessfully inoculated, or on those who had suffered not from small-pox, but from chicken-pox or measles; and the latter that the subjects vaccinated had no marks to indicate that their statement that they had been inoculated was correct, and that several of the old men who were vaccinated had been inoculated in their childhood. The Deputy Superintendent of the Suburbs of Calcutta notes that he has found that in the majority of instances previous inoculation does not prevent vaccination proving successful.

214. The marginal table furnishing this information shows that the best outturn of work was achieved by the vacciators in the Orissa and Darjiling Circles, the worst by those in the Behar Circle and in the Municipal Area, and tolerably good work by those in the rest of the circles; but in comparison with the work of the preceding year, increased energy was displayed by the operators in only the Sonthal Pergunnahs and Darjiling Circles, as opposed to a decline of work in the remaining circles, notably in the Eastern Bengal Circle and the Suburbs of Calcutta.

Average number of Operations performed by each Vaccinator.

215. An examination of the table given in the margin, which exhibits the work performed by the Licensed and Government Agencies during the year under review, shows a large amount of work in favour of the former, but the number of operators is in excess. The average of operations by each vacci, nator is in favour of the Government men.

Comparative value of work performed by the Licensed and Government Agencies

	Number of Operators.	Total number vaccinated.	Total number of Primary Vaccinations.	Total number of successful Primary Vaccinations.	Total number of successful Infant Vaccinations.	Total number of Children successfully vaccinated.	Total number of successful Adult vaccinations.	Average operation by each Vaccinator.	Proportion of Population protected per 1,000.
Licensed Agency	1,157	1,004,753	1,004,508	1,000,987	161,395	702,793	136,799	868	20·30
Government Agency ...	306	279,421	274,460	267,192	38,020	188,336	40,827	913	5·46

216. The marginal table furnishes this information. Analysed, it demonstrates that on the whole in both the Vaccination Circles and the Municipal Area children of one year and under six years of age were, as usual, best protected, infants next, and adults least; but that in the Vaccination Circles individually considered there were great variations, for while the abovementioned features were presented by Calcutta and its Suburbs and the Darjiling, Ranchi, and Sonthal Pergunnahs Circles, infants were least protected in the Metropolitan, and most so in the Vaccine Depôt, where also the children and adults were vaccinated at equal rates; and adults were better protected than infants in the Eastern Bengal, Orissa and Behar Circles. Compared with the figures of the preceding year (*vide* paragraph 222 of the Report for 1884-85), it will be seen that a larger proportion of infants and children were vaccinated this year against a smaller proportion of adults.

Vaccination according to Sex.

217. From column 6 of Statement No. 1, Appendix V to this Report, it will be seen that 666,637 males and 617,537 females were vaccinated, which, added to 48,083 males and 36,739 females in the Municipal Area, makes an aggregate of 714,720 males and 654,276 females were vaccinated this year. It will also be found that calculated in the total number vaccinated, the proportion of males operated on exceeds that of females in every Vaccination Circle as well as in the Municipal Area; the aggregate percentages being 51·91 males against 48·08 females in the Vaccination Circles, 56·68 against 43·31 in the Municipal Area, and 52·20 against 47·79 in both areas combined. Following the same process in relation to Populations, it appears that males were protected in larger proportion than females in every circle excepting Calcutta and its Suburbs, and that on the whole 2·75 per cent. of the male population and 2·51 per cent. of the female received protection; the protection in the Vaccination Circles being represented by 2·71 males and 2·49 females, and in the Municipal Area by 3·62 males and 2·92 females.

Vaccination according to Class or Religion.

	Vaccination Circles.	Municipal Area.	TOTAL.
Christians ...	3,188	1,041	4,229
Hindus ...	756,195	60,480	816,675
Mahomedans ...	493,495	22,054	515,549
Other Races ...	31,296	1,247	32,543

218. Columns 20 to 23 of the Statement cited in the immediately preceding paragraph show that the numbers vaccinated according to Class or Religion stood as exhibited in the margin. These figures indicate that with reference to the gross numbers vaccinated, the largest proportions of the operations were, on the whole, performed on the Hindus, next on Mahomedans, third on those returned under the head of Other Races, and least on Christians; the percentages being 59·65, 37·65, 2·37 and ·30, respectively; and that relatively to Populations protected the greatest protection was afforded to Christians (3·61 per cent.), next to Mahomedans (2·74 per cent.), then to Hindus (2·60 per cent.), and least to the Other Races (2·09 per cent). The circles individually considered in the latter respect show that the Christians were better protected in the Calcutta, Metropolitan, Eastern Bengal and Orissa Circles than in the other circles, the Hindus in the Suburbs of Calcutta, and in the Ranchi Circle, and those designated "Other Races" in the Darjiling, Sonthal Pergunnahs and Behar Circles. The Mahomedans did not take precedence in any circle and no Christians were vaccinated in Behar. The Superintendent of the Ranchi Circle says that the classification of operations in his circle, as far as concerns the heading Hindus, is incorrect and misleading, as the great bulk of those who are styled Hindus in Lohardugga, Palamow, Singbhum and the Native States are not only not Hindus, but are not even of the Aryan race, but belong to Aboriginal and Semi-aboriginal tribes, chief among whom in point of numbers are the Urāons, Mūndas and Hos.

Protection afforded to the number Born during the year.

CIRCLES.	Estimated births at 30 per 1,000 of population.	PROPORTION PER CENT. ON NUMBER BORN.

GRAND TOTAL ...	1,556,478	13·73	9·48	76·78

219. The marginal table supplies this information. It indicates that, on the whole, only 13·73 per cent. of the infants born, estimated at 1,556,478, were protected during the year, and that eliminating this proportion and that of the infants who died (9·48), there remained at the close of the year the large ratio of 76·78 of unprotected children; and that in no circle was the total number of children born wholly protected, but that the Suburbs of Calcutta, Calcutta, and the Ranchi and Darjiling Circles did the best in this direction in the order named. Contrasted with the results of 1884-85 (*vide* paragraph 225 of the Report of that year), only the Suburbs of Calcutta and the Metropolitan, Darjiling and Orissa

Circles exhibit improvement, the largest reduction having been effected in the Ranchi Circle.

220. This information is given in the table in the margin. It shows that 4,135 villages were visited for the purpose of inspecting vaccinations by the Superintendents, 4,110 by the Deputy Superintendents, and 32,223 by the other subordinate vaccinating staff; that the percentages of the total number of vaccinations examined by these three classes of officers were respectively 9·37, 13·74 and 58·54; and that the proportions per cent. of successful vaccinations ascertained by the same officers were respectively 96·49, 97·09 and 98·03. In comparison with the work of the preceding year (*vide* paragraph 226 of my Report for that year) there was a decrease in the work of the Superintendents under all the three above-mentioned heads, an increase of villages visited and of percentages of inspections of vaccinations against a decrease in the percentage of successful cases observed in the work of the Deputy Superintendents, and an increase of the work of the other subordinate vaccinating staff under all the heads.

Degree of Supervision exercised by the Inspecting Staff over the work of the Vaccinators.

A review of the work of the subordinate vaccinating staff shows that several of them performed meritorious and many unsatisfactory work; but as there are over a 100 of such officers, it would be simply carrying this Report to an undue length to note the merits of their individual work.

I should mention that I visited during my inspection tours all the Vaccination Circles, excepting Sonthal Pergunnahs, and communicated with their Superintendents on matters relating to vaccination and sanitary questions. I have also strictly scrutinized the monthly diaries of all officers who submit these commending good and condemning bad work. My impression leads me to believe that, some individual cases excepted, good work has, on the whole, been performed during the year.

From the above table it will be seen that the total cost of vaccination during the year amounted to Rs. 1,66,711-8-9, which was borne by the Government agency to the extent of Rs. 76,709-8-10, by the Licensed agency to the extent of Rs. 78,847-14-8, and by the Municipalities to the extent of Rs. 11,154-1-3; that the cost of each successful vaccination conducted by the three agencies in question was annas 4 and 7 pie, anna 1 and 3 pie, and annas 2 and 3 pie, respectively, and that, on the whole, it amounted to 2 annas per case; that, compared with the cost of the preceding year, all the three groups of areas exhibit increase both in gross cost and average cost per case, the excess being represented by the figures given in the margin. Taking the circles individually, there was excess of cost per case, to a more or less extent, in all, excepting the Metropolitan circles, where it was equal.

Contributions to Cost of Vaccination from other sources.

222. In addition to the regular expenditure incurred for vaccinations in the Circles and Municipalities exhibited in the above table, the following contributions were made in aid of the work:—

Rs. 73-2 for two vaccinators for the Barrackpore Cantonment paid from Cantonment Fund. Rs. 30 paid by Northern Bengal State Railway for a vaccinator for vaccinating the children of the Railway employés and others. Rs. 24-5-9 for one vaccinator by Chandpur Tea Estate. Rs. 120 for one vaccinator for the Dinapore Cantonment paid from Cantonment Fund. Rs. 22-8-8 for one vaccinator for Jehanabad dispensary in Gya district, paid from Dispensary Fund. Rs. 48 for one vaccinator for Soorsund dispensary in Mozufferpore, paid from Dispensary Fund. Rs. 30 for one vaccinator for Tajpore dispensary in Durbhanga, paid from Dispensary Fund. Rs. 60 for one vaccinator for Durbhanga dispensary paid by the Maha Rajah of Durbhanga. Rs. 58-1 for one vaccinator for Naraya dispensary in Durbhanga, paid by the Maha Rajah of Durbhanga. Rs. 139-15-8 paid by the Rajah of Hutwa for two vaccinators for Hutwa dispensary, one vaccinator for the Gopalgunge dispensary, and one vaccinator for the Bhori dispensary. One vaccinator worked in the Cuttack Cantonment, but the cost has not been furnished. Two vaccinators were entertained at the Dhenkanal Tributary Mehals, but the cost has not been furnished. Two vaccinators were entertained at Jamalpore, East Indian Railway, but the cost has not been furnished.

Explanations accounting for the increase in the Gross and Average cost of operations.

223. *Calcutta.*—The increase in gross cost is stated to be due (1) to the additional establishment which was entertained for only July and August of 1884-85 having to be maintained throughout the year under review; (2) to the expenses of the calf vaccination having been incurred all the year round instead of four months in the previous year; (3) to the pay and allowances of the Deputy Superintendent hitherto paid by Government having, since the 1st of July 1885, been borne by the Corporation under orders of Government. The increased average cost per each case is due to the increased expenditure above referred to, and to the gross cost having to be distributed over a smaller number of vaccinations performed during the year. *Metropolitan Circles.*—Increase in gross cost is due to Dr. Ghose's pay being less than that of Dr. Gupta in 1884; to the Inspectors having drawn more travelling allowance this year; and to the post of Superintendent having been vacant for nearly three months in 1884. *Ranchi Circle.*—Increase in gross cost is due to the present Superintendent drawing a somewhat higher pay; to the Deputy Superintendent having been granted a higher pay owing to his having been promoted to the 2nd grade of Assistant Surgeons; to the breaking up of a party of 10 vaccinators in the middle of the season 1884-85, which did not occur during this season; to a portion of the contingent expenses undrawn in the preceding year, being debited to this year's account; and to increased travelling allowance incurred.

The increase in average cost per case is due to the gross cost having been spread over a smaller number of operations. *Eastern Bengal Circle.*—Increase in gross cost is due to the appointment of two Inspectors. *Behar Circle.*—The increase in gross cost is referred to the Superintendent having drawn a higher rate of pay during the whole year, and to greater expenditure under the head of travelling allowance, and to Inspectors having drawn pay in 1884-85 only for six months, whilst during this year they drew it throughout the year. Increase of cost per case is due to increase of expenditure and to decrease in the number of operations. I think however, the the large decrease in the number of vaccinators must be the chief factor in increase of cost. *Orissa Circle.*—The cause of increase in total cost was increase of establishment, viz. two Inspectors for licensed system of vaccination, one mehter for office, and 12 apprentices' subsistence allowance during the time they were in training to practice as Licensed vaccinators.

Particulars regarding Licensed agency.

224. The licensed vaccination system was newly extended to thanas Jajpur and Dhurmasala in Cuttack, and it was more extensively carried on in the Eastern Bengal and Behar Circles. The scheme is now in operation in every circle—in the whole of the Metropolitan Circles and in parts of the others. The Officiating Superintendent of the *Metropolitan Circle* notes that the Licensed agency scheme works better and tends to promote vaccination more than the Government agency scheme, the reason being that each vaccinator is anxious to earn as much money as he can, and therefore uses every means in his power to obtain the largest possible number of childern to vaccinate, and he is of opinion that those men who have served as apprentices and have not been inoculators make the best vaccinators. In the *Ranchi Circle*, in order to obviate as far as possible the great difficulty hitherto experienced in rendering the Licensed vaccinators amenable to discipline, it was determined to take securities from them before granting them licenses to practise during the season under report. Twenty-one men in Lohardugga complied with this demand, and a deposit of Rs. 10 was taken from each of them. In Hazaribagh, however, this security could not be obtained, so the vaccinators were engaged on the usual terms, and here much inconvenience was caused by the vaccinators going away to their homes at the close of the season without having their work inspected. The Civil Surgeon of *Durbhanga* employed experimentally a number of ex-inoculators to vaccinate in different parts of the district; but on my objecting to his action, when I visited the Municipality, on the ground that experience showed that without proper supervision these men very often practised inoculation under cover of their licenses, he withdrew their licenses. They had, however, been employed for two months, and no instance of their having practised inoculation was known. Mr. Sharp, the Magistrate of *Maldah*, reported some irregularities on the part of the Licensed vaccinators of his district, which more stringent supervision would have tended to check.

With regard to training men as vaccinators, it is the practice in the *Darjiling* Circle to place under each Licensed vaccinator one or more apprentices to be trained on the theory and practice of vaccination. The Inspectors select the men and the Deputy Superintendent and Superintendent test their competency, before they are appointed as vaccinators. Similarly, Umedwars were attached to each party of vaccinators in the *Ranchi Circle*, and Dr. Owen, before the season's work commenced, delivered several lectures on vaccination to them and made them take notes. The result was, it is said, satisfactory. In the *Sonthal Pergunnahs. Circle* some inoculators were entertained as apprentices, but instead of vaccinating they practised inoculation. The Superintendent of the *Eastern Bengal Circle* reports that inoculators now apply, some to be instructed, others to be examined in vaccination; that no man of this or any other class obtains a license without previous training and examination; that those inoculators who can write enough to enter names in a register have preference given them; that all the Inspectors and head-vaccinators have strict orders to encourage them to learn and practise vaccination; and that "taught and licensed they practise vaccination with fidelity." Twelve men in the *Orissa Circle* and 19 inoculators in the *Behar Circle* were trained as vaccinators during the year. The former were granted licenses to practise.

Great difficulty was experienced in realising fees in some villages in the Birbhum and Murshidabad districts in the *Metropolitan Circles*, in the *Orissa Circle* generally, and in the Patna district in the *Behar Circle*. In the first-named circle the opponents were the Ferazis. In the *Behar Circle* the people of Patna, belonging to the agricultural class, would not think of paying the fees till the paddy crop had been harvested ; but even at other times no amount of persuasion could induce them to pay, and the vaccinators were unwilling to take legal proceedings to recover the fees which are small and distributed, and as great expense would have to be incurred in adopting this course—they were therefore compelled to accept payment by instalments. The Superintendent of this circle observes that unless this evil is checked, good men will not come forward to serve as Licensed vaccinators, for, as it is, the better classes of the Beharis dislike the work.

Attitude of the people towards Vaccination. Opposition offered. Local aid rendered.

Attitude in the Vaccination Circles.

225. In my Report for 1884-85 (*vide* paragraph 248) I mentioned in full detail the classes of the population who persistently opposed vaccination in each Vaccination Circle and in several Municipalities, and the causes which induced them to do so. As the local reports of the year under review furnish much the same information, I need not burden my Report by a recapitulation of it. I will therefore confine myself here to reporting the improvement that has taken place in the attitude and feeling of the people towards vaccination; to noticing the most marked instances of opposition and hostility to the measure indicating Government interference ; and to bringing forward the names of persons who have accorded valuable assistance in promoting the cause of vaccination, disclosed in the reports of this year.

The Superintendent of the *Metropolitan Circle* reports that in the large majority of the villages inspected by him, no opposition whatever to vaccination was exhibited, but that, on the contrary, the villagers seemed to have absolute faith in the measure ; that the Ferazis in the Bagirhat sub-division, who persistently opposed vaccination for years, have accepted it this year through the exertions of Inspector Hazi Mahomed Jan ; that the prejudice in Jessore is being gradually overcome ; and that very little opposition is offered by the resident population in the Suburbs of Calcutta, who appear to be satisfied with the advantages of vaccination as a preventive of small-pox. In the *Darjiling Circle* vaccination is freely accepted, excepting in thanas English Bazar and Maldah, and in small portions of the Rajshahye, Rungpore and Julpaiguri districts. In the *Ranchi Circle* the resistance in the Kolhan was overcome to a great extent this year by the employment of Government instead of Licensed vaccinators whom the people were too poor to pay owing to successive failures of harvest, and by providing Brahmin operators, as curiously the Hos, the inhabitants of the Kolhan, although non-Aryan and having nothing in common with the Hindus, have come to esteem the Brahmins to a degree little short of veneration. The Superintendent adds that, on the whole, active resistance was exceptional and when offered was generally overcome, and that vaccination is most readily received by the aboriginal and semi-aboriginal tribes and low caste Hindus. In the *Sonthal Pergunnahs Circle* the Sonthals generally appreciate the benefits of vaccination, but a class among them, known as the Kheroar or Sappa, are still hostile to the measure. *Eastern Bengal Circle.*—The Superintendent had no reason to modify the opinion he submitted in his last Report, *vide* page 135 of my Report for 1884-85. In the *Behar Circle* the Mahomedans generally appreciate vaccination and exhibit little opposition, and a change for the better was observed among some of the Brahmins and Rajpoots, who were hitherto strong opponents. It is also satisfactory to learn that the Superintendent received letters from some of the punchayets in four villages in thana Belouti in Shahabad, requesting that their children might be vaccinated and stating that fear had restrained them from vaccinating them when the vaccinator visited their villages. In the *Madhubuni* sub-division in Durbhanga the people are, according to the Magistrate, being gradually reconciled to vaccination. In the *Orissa Circle* the low caste Hindus and Mahomedans and the Native Christians did not raise objection, and it was noticed that the feeling of opposition is less strong in the mofussil than in the towns.

226. In the *Municipal Area* vaccination is favourably received and partial or no opposition offered in the following towns :—Midnapore, Ramjibanpore, Khirpai, Ghattal, Berhampore, Jungipore, Baraset, Hughli, Bankura, Bogra, Sherpur, English Bazar, Dinajpur, Jalpaiguri, Darjiling, Purulia, Ranchi, Dumka, Nasirabâd, Sudharam, Comillah, Faridpore, Backergunge, Sarun, Barrh and Jamalpore. In the last-named town, situated along the East Indian Railway line, the objection has been removed by the Railway authorities insisting on the production of a certificate of vaccination by all employés for themselves, wives, families and servants. In the Madhubuni town in Durbhanga reluctance to vaccination is markedly wearing away. In the Behar town some leading men encourage vaccination and consequently great advance is being made in the progress of the measure. It is a favourable sign that some petitions were received from some of the villages in the Barrisal district against the inoculators, and wishing for vaccination to check the evil effects of their practice. In the Faridpore town a family of up-country Brahmins, who were strenuously opposed to protection of any sort, having had five cases of small-pox with three deaths, have come to their senses, and accepted of vaccination. In the Chaibassa town objections have to a great extent died away since the appointment this year of a paid vaccinator, as the people were averse to the payment of fees. It is gratifying to learn that the upper classes of Hindus in the Northern Bengal State Railway line in Rungpore received vaccination gratefully, believed in, and appreciated the measure, exhibited no caste prejudices as to the description (humanized or bovine) of lymph used, and were willing to be vaccinated with virus taken from the arms of an English child or persons of other castes than their own. In the Khulna town the objections of the Ferazis are giving way. In the Serampore town 18 members of a family who had for years refused vaccination received it this year, and it is noticeable that the one remaining member of this family, who was absent in Calcutta, returned with small-pox. It is satisfactory to find that in the Sarun town the Marwaries who hitherto obstinately refused vaccination received it this year. This result was due to the influence of a few prosecutions under the Compulsory Vaccination Act. In city Murshidabad people are exhibiting signs of increasing appreciation of the value of vaccination as a prophylactic, and that the prejudices of even the bigotted and old Mahomedans are fast giving way.

Attitude in the Municipalities.

227. The following are the most marked instances of opposition offered this year. *Metropolitan Circles.*—In the Putia village in thana Keshubpore in Jessore a sect of Hindus called "Bhowani," consisting of about 50 persons, would on no account whatever accept of vaccination, as their belief is that "whatever God does no one can prevent," and in this belief they never take any medicine when they are sick, but only utter the name of their God. *Darjiling Circle.*—In thana Gomastapore in the Maldah district the Ferazi children are unprotected owing to the determined opposition of their parents, and the zemindar of Kadibary in thana Nawabgunge in Bogra refused to have his family vaccinated. In the *Ranchi Circle* great opposition was offered at Garjusoran in Kharakdiha in Hazaribagh by two brothers, Brahman illakadars, named Munie Ram and Deli Ram. *Eastern Bengal Circle.*—The Magistrate reports that the Ferazis in villages in Chandpur in Tipperah obstinately refused to submit to vaccination, because they said that the fanatic Dudu-Meah had forbidden the practice. It is believed that nothing short of legislative action will overcome their resistance. *Sonthal Pergunnahs Circle.*—The Deputy Commissioner observes that he received complaints during the year that the people in Dumka, particularly the aboriginal races, oppose vaccination because they do not like foreign vaccinators, who consequently are unable to secure confidence and trust. *Behar Circle.*—In the thanas in Shahabad newly taken up this year the people were strongly opposed to vaccination, and went so far as to assault the vaccinators; prominent among the opponents were two zemindars of Khalaspore. They were imprisoned for 15 days each for assaulting the vaccinators. This created a sensation among the people and induced them to yield to vaccination to a certain extent.

Opposition in the Vaccination Circles.

228. In the Rungpore town there is a good deal of opposition to be contended with, especially among the Kayahs or Hindustanis of Mahigunge and the Mahomedans.

Opposition in the Municipalities.

Great opposition to vaccination is displayed in the Colgong town particularly by the Marwaries and Brahmins who cannot be made to submit to the measure unless notice under the compulsory law is served on them. Many grown-up children are consequently still unprotected. In Madaripore and Goalundo the followers of Dudu-Moah are averse to every form of protection, but most strongly to vaccination. The lower classes in the Dinapore town threatened the vaccinator and prevented him from vaccinating their children. In the Mozufferpore and other towns in the Mozufferpore district the Beharis having implicit confidence in inoculation on religious grounds are strongly opposed to vaccination. *Motihari and Bettiah towns.*—The Civil Surgeon says that he has seen persons with young children looking on when he was vaccinating or inspecting vaccinations in the bazar, but who, on being requested to have their children vaccinated, either refused or carried away their children hurriedly. In Dhenkanal in Cuttack a curious belief prevails, viz. that when any member of a family is attacked by small-pox no children of that family should be either inoculated or vaccinated, as to do so would invoke the displeasure of the goddess of small-pox called "Mongolla." In the Cuttack town the Bhujpooriahs depend for protection on the natural disease only, and many parents sometimes go so far as to destroy the vesicles in order to prevent lymph being taken from the arms of their children.

Aid rendered.

229. The following persons, official and non-official, are reported to have rendered valuable assistance in furthering the cause of vaccination. *Government officials who assisted*:—Magistrates of Burdwan and Birbhum; Colonel Lillingstone, Deputy Commissioner of Lohardugga; Colonel Garbett, Deputy Commissioner of Hazaribagh; Mr. Ainslie, Assistant Commissioner of Palamow; Joint-Magistrate of Ranigunge; Baboo Soshi Sidhu Atta, Deputy Magistrate of Perozepore in Backergunge; all civil authorities in Patna; and the Sub-Divisional Officers of Ranaghat and Kushtea in Nuddea, of Govindpur in Manbhum, of Jamui and Beguserai in Monghyr, of Banka and Mudehpur in Bhagulpore, and of Buxar, Sasseram and Bhabuah in Shahabad. *Police*:—Sub-Inspectors of Gangajalghatti in Bankura; Head-Constable Anka Pershad of thana Kharakdiha in Hazaribagh; and all police officers in Patna. The *Municipal Commissioners* of Tipperah, Hughli, Midnapore, Ranaghat, and Ghattal. *Private persons*:—Baboo Suryanath Chowdhury of Ichapore in thana Gaighatta in Jessore, Baboo Bajrung Shahi of Ranchi, the Manager of the Dhenkanal Estate in Cuttack, and the native gentlemen in Kishnaghur in Nuddea who allowed vaccine stations to be located in their private residences.

Extension of the Compulsory Vaccination Act and other particulars relating to the working of this law.

Chattra	Municipality.
Mozufferpore	„
Serajgunge	„
Arrah	„

230. This Act was introduced during the year under review into the places named in the margin. In regard to the working of this law there is great divergence. In several of the Sudder Municipalities its provisions are properly attended to; in some they are not, but in almost all the minor towns they are but partially enforced. The defects are mainly that in many towns vaccine stations have not been opened; that in most of those towns where they have been opened the people are not compelled to resort to them; that the vaccinating staff is incommensurate with the requirements of the town, and is kept on for either three, two, or even one month; that no fee is charged for home vaccination, because the people being unwilling to resort to the vaccine station, the vaccinators are compelled, in order to protect them, to proceed to their houses. I subjoin a few illustrations of the above observations. The irregularities in the mode and plan of operations in the *Suburbs of Calcutta* noticed in my reports for 1884 were completely rectified during the year under review. The Compulsory Vaccination Act was fully enforced; all the depôts were opened for vaccination regularly on certain fixed days; and notices under schedule D of the enactment were issued on 860 persons, of whom 422 were prosecuted and 112 convicted and fined, excluding the acquitted and some who left the jurisdiction on receipt of summonses. The effects of these measures have been that the unvaccinated children were brought in crowds to the depôts; the number of children under one year vaccinated has increased from 1,819 to 2,810, and very few children were left unprotected, so much so that the Officiating Superintendent could not, he says, during his inspections

of the bustees find a single child unvaccinated, excepting a few who were not permanent residents. Another good result is that small-pox was absent from the Municipality during the year, a few sporadic cases of it which occurred in its northern division excepted. For home vaccinations Rs. 72 were realized against Rs. 123-4 in 1884. Taking the number of registered births amounting to 5,853, and deducting from this number the 2,810 children who were vaccinated and 1,092 children of the same age who were reported to have died, 1,951 children are found to be unprotected. Under the statement above made by the Officiating Superintendent it is clear that the parents or guardians of these children must have removed them from jurisdiction on receipt of notices calling upon them to have them vaccinated. It is gratifying to find from the Civil Medical Officer's report that in the towns of *Bankura* and *Bishenpur*, where the Compulsory Vaccination Act has been introduced, it is scarce to meet an unprotected person. This with the fact that the people are apathetic in all matters relating to preventive medicine and fondly attached to traditions, induces him to suggest that that it is of the utmost consequence to introduce the compulsory law into the district, and empower the licensed vaccinators with authority to prosecute recusants. The Magistrate coincides with this view of the matter. *Calcutta.*—The Superintendent says that the feeling of opposition is very great, and it will take years to overcome it. The intelligent and ignorant both avoided coming into the stations during the lymph-taking season, and the latter would not consent to go to a private house even if very liberally paid. It is instanced that a beggar woman who would find it hard to earn two or three annas a day by begging would not consent to take her child to a private house even if offered a rupee. For these reasons the Superintendent urges that the Compulsory Vaccination Act should provide that those who get their children vaccinated at a public vaccine station free of charge must allow at least one child to be vaccinated from lymph taken from their children. *Mozufferpore.*—At the meeting of the Commissioners of the Lalgunge Municipality, held on the 12th May 1885, the most extraordinary views were expressed by the whole body of them, the Chairman and Vice-Chairman dissenting. They said that they viewed the English method of vaccination with the greatest distrust; that they were averse to compulsory vaccination in that way; that while considering that compulsory vaccination was expedient, they thought that the native method of vaccination should not be disallowed; that they found that the introduction of the Act and the appointment of Government vaccinators would be tantamount to making vaccination according to the native method illegal. At the *Hajeepur* Municipality also the introduction of the enactment was considered a novelty and rejected on the ground that the measure was opposed to the feelings of the people. The Superintendent of the *Sonthal Pergunnahs Circle* says that he had no opportunity to test the working of the Compulsory Vaccination Law in the rural tracts of Bhagulpore and Monghyr where it is in operation. This he should have done specially, as it is important to know how the law is applicable to rural areas. In the *Gya* Municipality 1,220 prosecutions were instituted, but the persons were not proceeded against, as some lost their children, many had them vaccinated, and some had removed them, and as the Magistrate considered that this leads to needless harassment of the people who are already very much prejudiced, and that hence the law is rendered very unpopular. He however thinks the first thing necessary is to improve the birth registration with the view of securing identification of parents who have failed to vaccinate their children within the year—and this is now engaging attention.

Although introduced in 1884, the law was not worked in the *Durbhanga* Municipality, and not till after I had visited the Municipality and pointed out the omission, were its requirements attended to. The vaccinators objected strenuously to work under this system, so much so that rather than let the small remainder of the working season pass by without work being done, the Civil Surgeon was obliged to abandon the station system for this season and to revert to the house-to-house system of vaccination to which the vaccinators were wedded. Distinct opposition was offered by the higher castes of the Hindus. This will have to be met under the penal clause of the Act if it is repeated. *Port of Calcutta.*—In the absence of small-pox no notices under the Compulsory

Vacination Act were issued by the Health Officer. As usual, some of the crews of Maldive boats voluntarily had themselves vaccinated at the vaccine depôts. A case of small-pox having occurred on board a vessel, the vaccination department, at the request of the Health Officer, sent a calf on board and vaccinated all unprotected persons. It is gratifying to learn from Dr. Lynch's report that numbers, who were formerly prejudiced against vaccination with humanized lymph, are now readily and promptly taking to vaccination with bovine lymph.

The accounts of a few Towns or Unions which were converted into Municipalities during the latter part of the year have no place in the above table owing to the assessments of their municipal incomes not having been completed. From the above table it will be seen that the total income of the Municipalities during the year amounted to Rs. 30,41,223; that, contrasted with the income of the preceding year, there was a diminution of Rs. 237,103; and that of this income 40 per cent. against 38 per cent. was expended on Sanitary Works (original and recurring); 17 against 19 per cent. on Roads; 2 per cent. against the same proportion on Police; and 20 against 16 per cent. on other requirements, denoting that, notwithstanding a reduction of income, the apportionment for maintaining the sanitary status of the towns had exceeded that of the preceding year. Nevertheless, the towns, individually considered, did not exhibit similar activity in this important direction. Thirty-five out of 133 of them, viz., those named in the subjoined table, expended appreciable proportions of their resources in improving their condition; while 15, also cited below, allotted very insignificant proportions for

the like purpose. In the remaining towns (83) the percentages of income diverted towards sanitary improvements ranged from 16·10 to 39·86:—

Towns which returned appreciable results.	Percentage of Income.		Percentage of Income.	*Towns which returned insignificant sreutls.*	Percentage of Income.
Hazaribagh ...	68·76	Kishnaghur ...	47·07	Joynaggar ...	3·19

It is much to be regretted that such important towns as North and South Dum-Dum, Nuddea, Barrackpore, Sherpore and Monghyr should appear in the inappreciable list.

Details of Expenditure on Sanitation.

233. The marginal table shows the special purposes for which the amount assigned for the Sanitation of towns (Rs. 12,25,264 against Rs. 12,32,789 in 1884, exclusive of Rs. 5,04,811, the cost of constructing and maintaining roads) was expended, and the amount which was devoted to each of such purposes. In comparison with the expenditure of the preceding year, the principal increase is seen under the heads of Water-supply and Treatment of the sick, and the chief decrease under the head of Drainage. The increment under the head of Water-supply is traceable to Darjiling and some of the towns in the 24-Pergunnahs having spent much larger sums, the gross expenditure in these towns under this head amounting to Rs. 14,329 against Rs. 3,737 in Darjiling, and Rs. 63,156 against 1,662 in the towns in the 24-Pergunnahs; and under the head of Treatment of the sick to most of the towns having allotted larger sums for this purpose, particularly some of those which were influenced by the inundations, or to which sufferers from this cause were driven, Midnapore having alone expended Rs. 10,225. On the other hand, the decrease under the head of Drainage is attributable to Gya, Patna and some of the towns in the 24-Pergunnahs having expended considerably lesser amounts, viz., Gya Rs. 872 against Rs. 10,579; Patna, Rs. 2,191 against Rs. 25,782; and the towns in the 24-Pergunnahs Rs. 9,158 against Rs. 13,032. It should, however, be mentioned that it does not appear that any portion of the expenditure above detailed has any connection with *original* Sanitary Works, excepting some portion of that incurred under the head of Water-supply in the Darjiling town.

	Total cost.		Difference in 1885.	
	In 1885. Rs.	In 1884. Rs.	Increase. Rs.	Decrease. Rs.

General progress in Sanitation in the Towns and Districts.

234. The above table gives the gross expenditure incurred for sanitary purposes, including recurring charges incidental to every year; but the amounts expended from municipal funds for carrying out *original* Sanitary Works during the year, which directly indicate the actual progress made in sanitation in the towns, are exhibited in abstract, under the several heads for which they were incurred, in the following table. Details of these works will be found summarised in Appendix IV to this Report, which also contains a description of the *original* Sanitary Works which were executed in the *districts* at other than municipal cost. It will also be observed that several of the

Sanitary Works were undertaken as relief measures to ameliorate the distress entailed on the people from failure of food-supplies caused by drought, excessive rain, inundations, the cyclone, &c. I should also state that the cost of many works undertaken during the year have not been furnished, and that in order to avoid prolixity many works of minor utility, such as those relating to medical relief, acquisition of land, extensions of drains or roads, &c., which, however, in the aggregate have conduced to advance sanitation, have been omitted from the above-mentioned Appendix and subjoined table :—

235. Of the Sanitary Works which were undertaken or were under consideration during the year, those which claim attention as important sanitary measures calculated to confer much benefit are the following:—

Important Sanitary Works which were undertaken.

236. **Water-Supply.**—In *Burdwan* a further sum of Rs. 39,985 was expended in completing the water-works, a description of which was furnished in my Report for 1884. The filtered water continues to confer immense benefit to the towns-people who use it, and it is asserted by the Civil Surgeon that it has diminished sickness and mortality in the town and this opinion, it is said, is shared by the medical practitioners, who represent a respectable number. In the *Faridpore* town several tanks and ghâts were reserved, the former exclusively for drinking, and the latter for bathing purposes, cattle being excluded from them. In the *Midnapore* town many foul tanks were drained and numerous tanks in similar condition were closed during the cholera epidemic. The water-supply question in the *Howrah* town has been long, and is yet under, consideration. The Civil Surgeon says that every Commissioner is anxious for pure water, and will exert himself to get it as soon as he knows—(1) what it will cost to have a sufficiently ample supply; (2) how the money is to be raised for the work; and (3) how the rate is to be levied for it in a town where the rate-payers most highly assessed will be those least able to make use of the supply. He has not seen a practical answer to any of these questions. Preliminary arrangements are being made for an artificial supply

In Towns.

of good drinking water in the portions of *City Murshidabad* at a distance from the river where the want of water is much felt. The question of permitting house connections with the water-pipes is under consideration in the *Darjiling* town, but before this can be done a larger supply is required from the head works. Moreover, many more hydrants are required for the town. I think that the object to be carried out should be an increase of, and not the artificial limit of, the present supply, which is stated to be insufficient. It appears that six additional springs are available, and have been gauged since October once a week. The tapping of additional springs, however, is not all that is necessary. A large main between Senchal and Jore Bungalow, and a larger than the present one between Jore Bungalow and the station, are required. On the 1st May 1886, I found that the water from one spring alone was sufficient to fill the Senchal main, and the other had to be disconnected. With reference to the proposed Gunduck filtered water-supply scheme for the town of *Mozufferpore*, which, as stated in my Report for 1884, was negatived by the Municipal Commissioners on untenable grounds, the Civil Surgeon says that he hopes that the question will be favourably reconsidered and the scheme carried out before some formidable outbreak of disease brings prominently to notice the necessity of the measure. The scheme for connecting the Gunduck river with the Chundrawati, in order to secure good water for the town of *Bettiah* in Chumparun, although feasible, has been suspended for want of funds. Local subscriptions, it is said, are obtainable, but Government aid is needed. The water-works project in the town of *Bhagulpore*, referred to in my Report for 1884, was taken in hand this year and is progressing. A scheme of water-supply for the town of *Cuttack* has been devised by the Superintending Engineer, Mr. Hughes, in connection with river water stored above the weir at Jobra. Two points have to be considered with reference to this scheme—*first*, the initial outlay, and, *second*, the subsequent annual expenditure. The first will, it is believed, be met by local subscriptions and the second by the levy of a water-rate. In the *Puri* town an experimental water-supply scheme is in hand. It aims at providing water from wells and a settling-tank near the Meetiary road. Iron pipes leading to the town will convey the supply for distribution.

In Districts.

237. With regard to the water-supply of the *chief stations* on the *Eastern Bengal State Railway line*, allusion to the bad condition of which was made in paragraph 276 of my Report for 1884, it was reported during this year that, for the purpose of securing good drinking water, a brick well had been sunk at the Kanchrapara station; filters had been provided at all the stations at which drinking water is supplied; a well similar to that at Kanchrapara will be sunk at the Poradha station if good water is obtainable by the Norton's tube test; and the water-supply tanks at Chooadanga and Bogoola will be enlarged and deepened. It was also proposed to excavate a subsidiary tank at Kanchrapara for the workshops. In the *Burdwan* district Government granted Rs. 5,000 for the improvement of the water-supply of the distressed tracts, and Rs. 30,000 were advanced under the Land Improvement Act to landholders and superior tenants for clearing out and deepening old and silted-up tanks and excavating new ones. These improvements will, it is calculated, prove highly beneficial to the people in a sanitary point of view, and supply irrigation to a large area of rice land. *Midnapore.*—Much was done for the improvement of the Khas Mehals or Government Estates. The total expenditure for this purpose amounted to Rs. 20,283. The sanitary works consisted of the construction and excavation of three tanks and two wells, repairing of two bunds, providing a drainage channel in connection with a bund in mouza Arasin, providing grambheris in no less than 64 places and 4 khals. *Nuddea.*—The enquiry into the quality of well-water in the Nuddea district, referred to in paragraph 261 of the Report for 1884, has been continued, and samples of water from the places marginally noted have been analysed. The results obtained are in no instance good; some waters may be described as "usable" for drinking purposes, but that of the Chooadanga lock-up is "suspicious," and the sample from Rajah's chuk in the Municipality of Kishnaghur distinctly impure. Most of these wells are favourably situated,

Sub-divisional compound, Kushtea.
Chooadanga lock-up.
Sub-divisional compound, Meherpore.
Sub-jail ditto ditto.
Rajah's chuk, Kishnaghur.
Ranaghat.

except the last two. The one at Kishnaghur is evidently affected by the neighbouring well-privies, while that at Ranaghat escapes this mode of sub-soil pollution. The enquiry, so far as it goes, is disappointing, as it leads to the belief that water derived from shallow wells in the Nuddea district is not likely to be of the quality which is desirable. It, however, by no means discredits the proposals of Mr. Hughes, when Superintending Engineer of the Circle, to sink wells into the deep water-bearing stratum. Twenty-two tanks were re-excavated in the Ranaghat sub-division, whereby the water for drinking and culinary purposes was materially improved. In the same sub-division the silted-up mouth of the Choorny, at the point where it had originally discharged itself into the Ganges, was opened. By this the Ganges water now enters the Choorny by the action of the tidal current, whereby good water has been secured for the villages skirting its banks.

238. **Drainage.**—*Midnapore.*—Levels were taken for carrying out the longcontemplated *Ghatal* drainage scheme, but the floods of August and September put a stop to all further action in the matter. Much was done for the improvement of the drainage of the *Midnapore* town. The big drains were rendered effective; the central drain was bunded up at Churnimarshi to clear the silt below the bund and to prevent the formation of pools of stagnant water; and new drains were cut in different parts of the town. *Murshidabad*—In *City Murshidabad* the Baluchar ward was surveyed and its levels taken with a view to introduce a regular system of drainage. Arrangements were being made to improve the state of the Bistopore bhil, in the east of the *Berhampore* town, by cutting a channel from the Khagra sluice to the *Natub* so as to flush the bhil with river water and improve the drainage. This, owing to its being a work of magnitude, cannot be carried out for want of funds. Drainage works for the *Beauleah* town were commenced and are being carried out with great activity by the Public Works Department, the expenditure having been met by public subscription. It is expected that drains Nos. I and II—the former situated in the eastern end of the town, and the latter passing through the central portion of it—will be completed before the next rainy season. But more funds are required before a complete system of drains to carry off the river water of the villages and fields in the suburbs of the town can be secured. A proper drainage scheme for the town of *Mozufferpore* has long been under consideration as an important and most pressing want. This year the levels of the drains in the town were taken; the Executive Engineer was requested to recommend a scheme; and provision was made in the budget of 1886-87 for carrying out the work. It is hoped that the Municipal Commissioners will be enabled soon to carry out the scheme to completion. *Bhagulpore town*—The Soojaganj bazar drainage scheme has been completed by the Public Works Department. It consists of a set of saucer drains laid throughout the length of the bazar with gradients towards certain outlets. This work is a great improvement. In the *Purneah* town the drains at Line bazar and Lalbagh were opened out and their bottoms lowered; a canal four miles long and 12 feet wide was excavated, and a splendid bridge was constructed over the Ganges and Darjiling Road for the drainage of the marsh in the old station. These works are calculated to have an important bearing on the drainage of this Municipality. The drainage scheme originally adopted in the *Cuttack* town was worked out as far as possible by the construction of a drain in the eastern end of the town from Samia Talao to the main channel to remove collections of water from jhils and low places in Buxee bazar, Kishurpore and Thorya Sai, and a further extension was commenced at Mahendipore by making a branch drain with two bridges.

In Towns.

239. The carrying out of the Supai drainage scheme in *Midnapore*, to which allusion was made in the Report for 1884, was continued at a cost of Rs. 73,800 during the year under review. In the *Dinajpur* district the drainage canal* for the town was maintained by the Road Cess Department. This is an important work. A commencement has been made in pergunnahs Gungamondal and Patikaia, north of Comillah, in the district of *Tipperah*, in establishing the old system of

In Districts.

drainage, the neglect of which caused increase of mortality. With this intention silted up water-courses are being opened out by the Road Cess Department. In the Government Estates in the Sasseram sub-division and in the town of Nasriganj, belonging to Government, in the district of *Shahabad*, commendable efforts were being made for the improvement of their drainage, conservancy and water-supply arrangements. These efforts were directed towards constructing kutcha drains along the sides of lanes to regulate the drainage; using the earth excavated in levelling the roads between the drains; cleansing foul spots and converting them into roads or open spaces with the view to prevent them being fouled again; filling up objectionable holes and converting large excavations into tanks; sinking wells, &c. Much progress was made in these directions. Four excellent wells were sunk and several more were in hand and sweepers were engaged to proceed from village to village and remove refuse. For these purposes Government gave Rs. 850, and the Joint-Magistrate was raising local subscriptions to progress with the work which is very expensive. The obstruction of drainage caused by the Bengal and North-Western Railway embankment, which runs for a length of 80 miles through the district of Sarun referred to in the Sanitary Report for 1884, received attention this year. The Railway authorities opened new culverts or barrel drains throughout the line wherever they appeared to the Magistrate to be wanted.

Sanitary defects.

240. **Port of Calcutta.**—The following facts were brought to notice by the Health Officer. On the shipping complaining against the latrine belonging to the Messageries Maritimes Compagnie and a private latrine, both situated on the banks of the river, the Suburban Municipality was communicated with to remedy the defects. It was found that foul water containing large quantities of night-soil was constantly discharged into the river from a khal which extends back from the river far to the east of Garden Reach passing through a crowded neighbourhood. On the banks of this khal there are numerous kutcha privies, the contents of which are thrown into the khal by the Suburban municipal mehters. There are numerous latrines on the river bank on Tolly's nullah and at other spots, the survivals of the old system of discharging the night-soil into the river or other convenient water-courses. This pollution of the river is a serious nuisance, but it constitutes only one of the many grave sanitary evils which obtain in the Suburban Municipality. Dr. Lynch says that "representations to municipal bodies are almost useless; the difficulty of controlling their conservancy establishment being apparently beyond their power." Complaints were made of the foul smells which escaped from the flushing inlet of No. 3 main sewer which leads from the river at No. 2 Jetty. Cases of cholera had occurred in two steamers at this jetty in April. In November the condition of the inlet was unusually offensive, torrents of sewer gas escaping under the jetty. Complaints were made, and it was explained by the Engineer of the Calcutta Municipality that the nuisance was due chiefly to the present deficiency of water for flushing purposes, but that arrangements were being made to remedy this defect. This is a serious evil which the Municipality should take particular care shall not recur.

Public Latrines on the Foreshore.

241. Two of these conveniences were opened during the year, one at Kidderpore below Hastings' Bridge, and the other on the Strand Bank at Ahiritollah.

Corpses and Carcasses in the River.

242. There was nothing to complain of under this head.

Water-supply.

243. Filtered water was, as usual, supplied to the shipping. No complaint on the subject was received, but the Health Officer suggests that the present primitive plan of carrying water to the vessels which does not preclude its pollution, should give place to properly constructed water tank-boats in which the water will be inaccessible, except through the pump, and in which facilities of cleansing will exist.

Value of Sanitary Improvements effected this Year.

244. Taking a general review of the progress made in sanitation as above detailed, I trust it will be allowed that a large amount of good and useful Sanitary Work was accomplished this year.

MISCELLANEOUS SANITARY OPERATIONS DURING THE YEAR.

Extension of Sanitary Laws.

245. The Bengal Municipal Act III (B.C.) of 1884 was extended during the year to the Towns or unions of Julpaiguri, Assensole, Ferozepore, Daudnagar and Tikari, and various parts or sections thereof, which had not been introduced into many Municipalities at the time the law came into operation, were extended to them during the year under review. Bye-laws, framed under this Enactment, were brought into operation into the Municipalities of Darjiling and Chittagong.

The places to which the Compulsory Registration Act IV (B.C.) of 1873, the Compulsory Vaccination Act V (B.C.) of 1880, have been extended, have been mentioned in paragraphs 11 and 230 of this Report.

The following Bills are at present under the consideration of the Bengal Legislative Council:—

The Bill to consolidate and amend the law relating to Village Watchmen which has a very important bearing on the Registration of Births and Deaths in Bengal in the manner described in paragraph 8 of this Report.

The Bill to amend the Bengal Vaccination Act V of 1880, the object of which is to correct the defects in the present Enactment in that it does not secure sufficient protection to immigrants, persons on board of vessels arriving in the Port of Calcutta, visitors, and temporary sojourners, and to enable public vaccinators to have reasonable access to dwelling-houses and to vessels in Port, to ascertain whether the inmates are protected or not.

The Bill entitled the Calcutta Municipal Consolidation Act, the main object of this Enactment being to amalgamate certain parts of the Suburban Municipality with the Calcutta Municipality, the proposed amalgamation consisting of portions of Entally, Baniapookur, Ballyganj, Talliganj, Bhowanipore, Alipore, Ekbalpore, Watganj and Garden Reach.

Sanitary condition of the Calcutta and Goalundo Emigration Depôts.

246. The reports received from the Inspectors of Emigration, Calcutta and Goalundo, which have been separately submitted to Government, show that the sickness and mortality in the depôts had diminished in comparison with their incidence in the preceding year, there being little cholera and no small-pox; and that there was nothing to complain of with regard to accommodation, food, water, medical assistance, vaccination, &c.

Effect of steeping Jute in water on health.

247. In obedience to orders in paragraph 12 of the Resolution of Government of the 31st October 1885 on the Annual Report of this Department for 1884, requiring me to notice specially in my present Report the question of steeping of jute in tanks and water-courses proving a harmful source of pollution of water, I issued a circular to all Civil Surgeons and Deputy Sanitary Commissioners requesting them to submit in their next annual report all the information they could collect as to where, how far, and in what manner the process has, by pollution of the water, proved prejudicial to health.

Before submitting an abstract of the reports received from the Civil Surgeons and from the superior Officers of the Vaccination Department, I should mention that Dr. Smith, when Sanitary Commissioner for Bengal, brought the evils of this practice to the notice of Government in his letter No. 219A, dated the 13th December 1869, but that it does not appear that any definite orders were passed on the subject; and that I also, on the motion of Dr. Ghose, the Civil Surgeon of Rungpore, did the same in my letter No. 743 of the 13th of March 1882. Dr. Ghose's opinion was that this measure has a deleterious influence on the public health, and is one of the potent causes of disease; and he suggested that, as legislation in this matter is questionable, and as it would affect a valuable industry of the country, a process, said to have been initiated in America for separating the fibre without previously decomposing the jute plant in water, be introduced into Bengal. The Government in reply [*vide* letter (Medical and Municipal Department—Sanitation) No. 75, dated the 27th March 1882] said that the Lieutenant-Governor's attention had shortly before been drawn to a machine said to have been invented by Messrs. Dennis and Angell, of the United States of America, for the preparation of the fibre of jute, and that the

Government of India had been asked to procure one of the machines, together with such further information as may be available in regard to the patent, for trial in Bengal. But I have not been favoured with any further communication on the subject.

Extent of country affected by the process.

Midnapore.	Mozufferpore.
Backergunge.	Sarun.
Chittagong.	Monghyr.
Noakhali.	Puri.
Patna.	Manbhum.
Shahabad.	

248. Jute is not grown in Gya, Chumparun and Singbhum, and very little, rarely, or only for home consumption, in the marginally-noted districts. No reports were received from Birbhum, Darjiling, Dacca, Faridpore, Durbhanga and Hazaribagh, and the reports from Hughli, Rajshahye, and Purneah contain no information of any value. The latter are therefore dismissed from consideration in this Report.

Jute-steeping is carried on generally or extensively in Jessore, Dinajpur, Rungpore, Bogra, Pubna, Monghyr, Bhagulpore, Mymensing, Tipperah, Maldah and Julpaiguri, particularly in Boda, Patgram, Julpaiguri and Shikarpore thanas and to the south and west of Mynaguri in the Julpaiguri district. On the other hand, it is carried on to a limited extent in Burdwan, Serampore, Howrah, Cuttack, in thanas Baraset, Goberdanga, Baduria and Basirhat in the 24-Pergunnahs, in Nuddea, in the Satkhira sub-division and in the north-eastern portion of the Khulna district bordering on Faridpore, in thanas Nowgong, Mandah and Burigram in Rajshahye, and in Purneah.

Waters in which Jute is steeped.

249. In Burdwan and Serampore the jute is steeped in pools and railway cuttings outside the villages, not in the drinking-water tanks; in Howrah in such ponds or tanks the water of which is not used at all for any purpose; in the 24-Pergunnahs in road-side drains and in small and old tanks, but not in tanks and water-courses from which drinking water is taken; in Nuddea in cess-pools and shallow bhils; in Jessore in water not used for drinking purposes; in Dinajpur and Rajshahye in tanks and water-courses; in Rungpore in any and every collection of water and in the side cuttings parallel to the railway; in Bogra in ponds containing rain-water, not in tanks; in Pubna in every lodgment of water in the fields or in the sides of roads close to dwellings and in the running streams; in Julpaiguri the most convenient piece of water in the jute field is selected, whether it be a drain or a special reservoir, sometimes close to the houses; in Mymensing in dobas, old tanks, khals, bhils, nullas, the river, hollows, holes and ditches; in Tipperah in khals, bhils, and ditches; in Purneah in pits and hollows and old channels of rivers which have no connection with the rivers, in the belief that water of a warmer temperature than river-water is necessary for the separation of the fibre, and consequently the process is not carried on in rivers and wells which supply the drinking-water in this district; in Maldah in khals or in stagnant pools and not in running streams or tanks; in Monghyr and Bhagulpore along rivers and water-courses, and in small excavations containing water left behind after subsidence of floods, and in Cuttack in jhils and khals in the vicinity of the villages.

Effects of the process on Health.

250. Under this head definite information has not been received from the majority of the districts, the main reasons being perhaps that the circular of enquiry was issued after expiry of the jute-steeping season, and that the inundations, occurring exactly at the time when the jute plants were in the fields, destroyed them. The steeping takes place in August and September. Noteworthy information has, however, been furnished from the following districts:—*Khulna.*—Dr. Ghose is unable, from his limited experience in this district, to state what relation the process bears to health in it; but he notes that "whatever gives rise to organic decomposition in the water, atmosphere, or soil, necessarily gives rise to specific diseases, such as fever, cholera and bowel-complaints. It tends also to reduce the physique and stamina of the people drinking such water, breathing such atmosphere, and living on such soil." *Dinajpur.*—Dr. Mookerjee states that, while the process certainly pollutes the water and must render it deleterious to health, it is difficult to say in what manner and how far it is baneful. Dr. Wood, the Deputy Sanitary Commissioner, and Tajamul Hossein, the Deputy Superintendent of Vaccination, Darjiling Circle, note that in their inspections of villages in several thanas in the Dinajpur district they found that the

popular belief was that the effects of jute steeping in water that is drank are fever, diarrhœa, colds and cough, colic, and vomiting. The former Officer adds that he was informed by Civil Hospital Assistant Koilash Chunder Chuckerbutty, in charge of the Rayganj Dispensary, that fever and diarrhœa are caused by drinking this water, as he saw many cases of this; that in village Aladi, in thana Neetapore, no ill-effect was observed although the polluted water is habitually drank; and that although it is drank by cattle, no disease follows it. *Rungpore.*—The Civil Surgeon says it is a nuisance and a cause of ill-health; but the Magistrate states that the water is not used for drinking by man or beast. *Julpaiguri.*—Dr. Ashe says that the people do not drink the water, but it is used for ablution and washing of clothes and utensils, and that he is of opinion that as the drinking well is situated close to the places where the jute is steeped, its water must of necessity be contaminated with decomposing vegetable matters, and that when evaporation of the water in which jute is steeped takes place in the winter months, it must add to the general unhealthiness of the district. *Mymensing.*—Dr. Moorhead, the Civil Surgeon, is of opinion that if jute is steeped in small tanks and the water used for drinking or culinary purposes, it is injurious and induces indigestion, diarrhœa and fever, and destroys the fish, and that those who eat the fish are subject to indigestion and diarrhœa; that the effects of the process if carried on in water-courses vary: if the water-course is of considerable size and there is a good current little or no injury appears to follow; but if the amount of water is limited and the current slow, more or less digestive derangements, and probably fever, result from using the water. *Noakhalli.*—The Civil Surgeon thinks that the stench arising from the process must add to the many insanitary conditions of the dwellings and their surroundings which cause unhealthiness; but that no special disease traceable to the process has been observed. *Tipperah.*—The Civil Surgeon notes that as the water is not drank, there is no detriment to health; but the Magistrate, Mr. Skrine, reports that a severe outbreak of malarious fever at Tandunk, in the north of the district, was distinctly traced to the pollution of the water-supply by the steeping of jute in tanks and streams, and he is of opinion that so long as such water is not drank no harm whatever arises, but that if it is drank without boiling it causes enteric fever. *Maldah.*—Dr. Wood, the Deputy Sanitary Commissioner, Darjiling Circle, states that the same diseases which occurred in Dinajpur, as above reported, are said to follow the use of water in which jute has been steeped in this district; and he adds that he was informed by Mr. Reily, the Manager of the Chanchal Estate, that jute water has the worst effect in exceptionally dry seasons, for then the process is carried on in tanks near the villages, and the villagers have no choice but to use the water of these tanks, or are forced to resort to other sources for their supply, or use water of filthier pools and puddles, and that this water kills the fish at the time when they spawn, so that one source of food-supply is destroyed. He adds that the villagers generally deny the use of water in which jute has been steeped, but that he found that it was being used in one village, and that the people said that its use produced no ill-effects. Assistant Surgeon Kasi Nath Ghosh, Deputy Sanitary Commissioner, Sonthal Pergunnahs Circle, reports that fever and cholera are known to prevail in most of the localities in his circle about the same time of the year (September, October and November) when the process of jute steeping is carried on; and that from this coincidence of facts it may be reasonably suspected that these diseases are the outcomes of a practice which cannot but contaminate the water to a great extent.

On the other hand, negative information on the subject was received from the following districts:—In *Burdwan* the people are not unmindful of the purity of their drinking-water. In *Serampore* no ill-effects were perceived or noticed, and the process is considered more a nuisance than injurious to health; but Dr. Gregg is of opinion that if carried on to a large extent it must affect the neighbourhood, and should not be permitted in Municipalities. In *Howrah* no instance has been recorded in which jute-steeping has proved a harmful cause of pollution of water. According to the observations of the Officiating Deputy Superintendent of Vaccination, Metropolitan Circles, the

popular opinion in Dumjoor thana is that jute renders water unfit for use, and the same Officer states that in some villages in the same thana he observed on both sides of the main road the jute plants rotting and rendering the water most offensive, so much so that no one could pass without putting his handkerchief or chudder to his nose. *24-Pergunnahs.*—Dr. Joubert says that the smell from jute undergoing steeping should be actively pernicious requires yet to be proved. The process is carried on at a time of the year when fever is specially prevalent everywhere, both in places where it is carried on and where it is not, so there can be no connection between the two facts; but the people appear to be generally of opinion that water in which jute is steeped causes diarrhœa, and so, as a rule, avoid such water. In *Nuddea*, *Jessore*, *Bogra* and *Sonthal Pergunnahs*, the process does not appear to have been injurious to health. In *Pubna* the water is not used for drinking or bathing purposes, excepting that of streams which does not seem to be polluted on account of their strong currents; and owing to the inundations and the prohibiting order issued by the Magistrate not to steep jute in streams with dull currents, the public health does not appear to have been injuriously affected. In *Cuttack* the process does not seem to affect much the health of the people; and the Deputy Sanitary Commissioner, Orissa Circle, says that the bhils and khals in which jute is steeped overflowing during heavy rains drains into the nearest rivers and reservoirs.

From the foregoing reports it is clear that the immunity from sickness is simply due to the people not using for drinking and culinary purposes the water in which jute has been steeped, for in the majority of instances, wherever such water has been used, sickness has followed its use. It is natural that the people should avoid drinking water having such a nauseous smell, but while, happily, the majority of the people do avoid such water, the instances are not wanting where they deliberately use it.

Collateral information elicited during the enquiry.

251. The Officiating Deputy Sanitary Commissioner, Metropolitan Circles, states that a good deal of bamboo steeping goes on in village Moshat, in thana Chunditolla in *Hughli*, which must be very injurious as it kills even the fish; but the villagers do not drink the water in which the bamboo is steeped. *24-Pergunnahs.*—Dr. Joubert mentions that the smell from bamboo-steeping is to his knowledge most overpoweringly nasty, but that it should be actively pernicious has yet to be proved.

Quarantine Station.

252. PORT OF CALCUTTA.—A suitable piece of ground, admitting of safety of anchorage, accessibility from the ship and the shore, and to leeward of the prevailing winds, &c., has been selected for a quarantine station in place of the station at Royapore, which is to be abandoned.

Issue of Bills-of-health to the Shipping.

253. Under instructions from the Government of India, the issue of Bills-of-health to the shipping by the Health Officer of the Port commenced from the month of September.

Sanitation promoted by District Officers and Others.

254. Mr. Warde-Jones of Birbhum exerted himself to effect the removal of dung-heaps and the keeping of villages in his Sub-division in a more cleanly state, and action was taken in the same direction through the Police by the Magistrate of the same district. The Managing Committee of Sreepore Hitoshadini Shova of the Debhatta Municipality have, with praiseworthy liberality, undertaken to distribute medicines to the poor and render assistance to the helpless of the town in question. In this way they afforded treatment this year to 213 persons suffering from cholera, fever, bowel-complaints, and other ailments, with the result that, excluding 40 patients who declined further treatment and three who remained under treatment at the close of the year, 166 were cured, and four died, the deaths being caused by cholera. Mr. A. D. Christian, of the Bongong Factory, in Bhagulpore, exerted himself to cleanse and fumigate the village during an out-break of cholera, but the village has since relapsed into its normal state of filthiness. Similar exertions were made by Munshi Syad Golam, Vice-Chairman to the Branch Road Cess Committee of the same district.

SECTION X.

PERSONAL PROCEEDINGS.

PROCEEDINGS OF THE SANITARY COMMISSIONER.

Officer in charge of the Office during the year.

255. I was in charge of the Office throughout the year.

256. The 27 marginally named Municipalities were inspected by me during the year, against the same number in the preceding year. Of these towns, the sanitary conditions of only Darjiling, Goalundo, Ranchi and Purulia were found to be fairly satisfactory, particularly of the first-named town. In all the rest many sanitary defects, more or less grave, existed; but Kishnaghur, Khulna, Nassirabad, Faridpore, Julpaiguri, Rungpore, Pubna and the Suburbs of Calcutta were in the worst possible condition, notably the last-named Municipality. Compared with their conditions at the previous inspection, Dacca, Naraingan j, Dinajpur, Bogra, Beauleah, Purulia, Puri, Barisal, Hazaribagh and Bankura were found to have effected creditable improvements; while in Faridpore, Rungpore and Chyebassa retrogression in sanitary status—the result of neglect—was seen to have occurred. Fuller details regarding the conditions of the towns inspected will be found in Appendix IV to this Report, and it will be shown hereafter that many of the minor towns were visited and inspected by some of the officers of the Vaccination Department. I should note that there is strong evidence in the annual reports, and in the proceedings at municipal meetings on sanitary questions submitted to this office, to indicate that much activity is displayed and a zealous attention maintained by the Commissioners of a good many towns with regard to the sanitary interests of the towns committed to their charge, while on the other hand instances of neglect and indifference are not wanting.

Other places inspected, and reports on sanitary questions relating to them submitted to Government.

257. In orders No. 1109, dated the 14th September 1885, I was requested to visit the villages and towns on the Grand Trunk Road and to the west of Hazaribagh where cholera was alleged to be actively prevalent, and to submit a report on the sanitary condition of the localities, and on the steps which should be taken for the better protection of the people from epidemic diseases. I was also desired in orders No. 105 of the 9th January 1886 to suggest measures for the proper conservancy of the places in which cultivators assemble to weigh opium. I submitted the required reports, and a brief *resumé* of my opinion and suggestions on both questions will be found in paragraphs 99 and 91 of this Report.

At the request of Government in endorsement No. 130, dated the 9th May 1885, I visited the Julpaiguri Jail, enquired into the health status of the prisoners, the sanitary arrangements obtaining in the jail, the condition of the jail buildings, &c., and suggested the following reforms with a view to bring about an abatement in the heavy mortality among the prisoners, the majority of whom showed full evidence of malarial poisoning, as was expected in prisoners drawn from the extremely unhealthy sub-terai district of Julpaiguri:—(1) Certain arrangements for the better ventilation and protection from rain of the sleeping wards; (2) more liberality in, and greater variety of, the diet of the prisoners; and (3) keeping the jail surroundings clear of rice cultivation carried on in the drainage channels near the jail, and keeping the neighbourhood of the Municipality free from low jungle.

My opinion being asked in orders No. 2552T—M of the 23rd November 1885 on the objectionable process adopted by the Manager, Eastern Bengal State Railway, in filling up some tanks near the Sealdah station, I stated that it was within my knowledge (and the action of the Calcutta Corporation, who have had great experience, pointed in the same direction) that dewatering tanks prior to placing rubbish in the hollows lessens the nuisance of a process which is always more or less disagreeable, and that I had seen the very worst conditions brought about by the neglect of this precaution, and by throwing sweepings into water to cut short the period within which offensive smells may be given out, as contemplated by the Manager. I added that if the tank is fully filled up to provide against sinkage, and no inward drainage is allowed so as to form a pool of foul water in the centre, there will be no foul smells arising from it, either during or after the rains, provided it is sufficiently covered with a deodorant layer of earth which is left undisturbed.

Exhibits relating to sanitation for the Administration Court of the London Exhibition of 1886.

258. In compliance with Government orders on the subject, I submitted the exhibits of this department for the Administration Court of the London Exhibition of 1886. They consisted of a note on the constitution, organization and functions of the department of the Sanitary Commissioner for Bengal in connection with its sanitary and vaccination branches; of the registers and returns kept up, and of appendices, consisting of the annual sanitary and vaccination reports prepared and submitted since the organization of the department in 1868; of an abstract statement showing the birth and death statistics from 1871 to 1884, of an abstract statement showing the number and other particulars of vaccinations performed during 1880-81 to 1884-85, and of the Enactments relating to the compulsory registration of births and deaths, to compulsory vaccination, to inoculation, to municipal administration, and to local self-government.

Lectures on Hygiene delivered at the Medical College

259. In the capacity of Professor of Hygiene in the Medical College, I delivered 20 lectures on the subject to 40 students.

PROCEEDINGS OF THE HEALTH OFFICER OF THE PORT OF CALCUTTA.

Inspection of Vessels.

260. The Health Officer of the Port of Calcutta inspected all the inward and outward bound vessels, the former numbering 780 with 35,879 European and native seamen on board, against 715 with 30,992 seamen in the preceding year, and the latter amounting to 626 vessels with 25,466 seamen, against 482 with 15,579 seamen, aggregating 1,406 vessels with 61,345 seamen against 1,197 and 46,571 respectively, *vide* details marginally given. These figures indicate that there was a considerable increase of inspections, which is reported to be partly due to the new system introduced in September of granting Bills-of-health after inspection of vessels. I am of opinion, from a review of the Health Officer's report, that good, assiduous, careful and exhaustive work had been performed by him.

PROCEEDINGS OF THE NATIVE SANITARY INSPECTOR OF THE PORT OF CALCUTTA.

261. The Native Inspector of the Port inspected 9,989 boats and 311 latrines, and found 238 of the former and 16 of the latter in a filthy condition; made 216 complaints to the police; traced 171 cases of sickness on board of boats; and inspected 126 police water-boats. Compared with the work of the preceding year, it will appear that less work was performed, particularly with regard to boats inspected; but it should be mentioned that the work above exhibited is short of that actually performed by the Inspector which cannot be shown, owing to the records of July and part of August having been lost when his dinghy was upset in the river during the dangerous freshets of August. The Health Officer is of opinion, and I agree with him, that this officer performed his duties satisfactorily, displaying much activity, intelligence and diligence in their performance.

PROCEEDINGS OF THE OFFICERS OF THE VACCINATION DEPARTMENT IN CONNECTION WITH THEIR SANITARY DUTIES.

Details furnished under this head.

262. Under this head, I propose in order to avoid prolixity, to omit mention of all ordinary descriptive and minor sanitary details of the villages inspected, recording only such observations as are interesting, deal with extremely insanitary local conditions, or point to some other marked peculiarities attaching to localities calling for the special attention of Government, particularly as it would be simply going over the same ground which was gone over in the Report of 1884, the villages in Bengal being in point of their sanitary status much alike. I should, however, state that the inspections of most of the officers in this direction were carefully performed, and that their observations, briefly summed up, disclose the following defects as common, to a more or less extent, to all the villages which were visited, with very few exceptions. *Dwellings* badly constructed, ill-arranged, crowded together and devoid of ventilation. *Roads* narrow and unmetalled, chiefly consisting of tortuous bye-paths, and unprovided with side drains. *Pits, hollows* and other *excavations* common and allowed to become receptacles of every description of festering filth or of stagnant water. *Conservancy* conspicuous by absence; defœcation and micturation being performed anywhere; human and cattle *excreta*, and all kinds of house and other refuse, being accumulated and permitted to fester near houses. *Water-supply* for drinking and domestic purposes taken from any source, no matter how polluted or fouled. *Drainage* mostly absent, or, if existing, defective and obstructed. And all these are the result of the apathy and indifference displayed by the people to the simplest elements of sanitation, and who moreover fail to recognize any wrong in conditions which have descended to them from their ancestors. The inspecting officers also tested registration, and their reports were forwarded to the local authorities for the necessary action, and during their tours they pointed out to the people the insanitary conditions in the midst of which they lived, and the probable effect of these conditions on their health status, and urged reforms in the matter. These points will not again be mentioned in this Report, unless it be necessary.

263. The number of villages which were visited by the Deputy Sanitary Commissioners and the Deputy Superintendents of Vaccination for sanitary inspections are exhibited in the marginal table. This table does not show the number of villages which were visited by Mr. Lyons, the Deputy Sanitary Commissioner of the Eastern Bengal Circle, as no report on the point or diaries (excepting the diaries for November and December) have been submitted by him, notwithstanding repeated reminders for them; and for fairness of comparison of the general results similar information for this circle for 1884-85 has not been inserted in the table. It should also be mentioned that of the 395 Deputy Sanitary Commissioner's village inspections in the Metropolitan Circle, 47 were made by Dr. Gupta and the remainder by Dr. Mullen: of the 281 in the Ranchi Circle, 105 by Dr. Owen and the remainder by Dr. Waddell; and that of the 2,390 Deputy Superintendent's inspections 74 had been made by Assistant Surgeon Neem Chund Gupta. Keeping these facts in view, it will be seen from the marginal table that on the whole the sanitary condition of 5,206 villages was enquired into this year, viz. of 2,816 by the Deputy Sanitary Commissioners, and of 2,390 by the Deputy Superintendents of Vaccination, against 4,819, viz. 2,579 by the former class of officers and 2,240 by the latter, indicating improvement in the inspection work of both the Deputy Sanitary Commissioners and Deputy Superintendents, represented by 237 additional villages inspected by the former and 150 by the latter, culminating in a net increase of 387 villages inspected. These inspections,

however, involve heavy clerical work in making the consequent reports, and I purpose to reduce their number during the next season. This, I think, can be done, and yet sufficiently full information afforded. Considering the inspections in each circle separately, improvement is indicated on the side of the Deputy Sanitary Commissioners of the Sonthal Pergunnahs, Orissa, Darjiling and Behar Circles, and of the Deputy Superintendents of the Metropolitan, Ranchi and Darjiling Circles, in the order named; and retrogression on the side of the Deputy Sanitary Commissioners of the Metropolitan and Ranchi Circles, caused no doubt by changes of officers, necessitating the new incumbents devoting the time they could have employed on inspection duty to learning the details of their work. On the whole, however, I hope it will be allowed that good inspection work has been accomplished during the year under review.

Work of the subordinate Officers of the Department.

264. The Inspectors, Native Superintendents and others holding similar rank visited 23,498 villages, against 25,769 in the preceding year for the purpose of ascertaining the number of deaths which occurred in them, and verifying the information obtained with the entries of the events made in the registers kept up at the thanas to which the villages are attached. A very large number of their verification statements were received and dealt with in the manner mentioned in paragraph 294 of my Report for 1884-85. The improvement in registration effected this year is no doubt associated with this procedure.

Submission of Diaries.

265. All the Deputy Sanitary Commissioners and Deputy Superintendents of Vaccination, excepting Mr. Lyons of the Eastern Bengal Circle, regularly submitted Diaries of the sanitary and vaccination work performed by them. The reports supplied in the diaries of this year were, with few exceptions, of a better character, and contained more carefully considered information, notably those of Dr. ffrench-Mullen and Assistant Surgeon Preumber Nath Mitter of the Metropolitan Circles; of Assistant Surgeon Kasinath Ghose of the Sonthal Pergunnahs Circle; and of Drs. Owen and Waddell of the Ranchi Circle. Commendable care was also bestowed by Mr. Naidu of the Orissa Circle in the preparation of his diaries. I am also glad to record that an examination of the diaries of this year disclosed much less perfunctory work than during 1884-85, *vide* paragraph 295 of that Report.

Reports on the Health condition of the Villages, &c., inspected, and recommendations made for rectifying Sanitary defects.

266. The following condensed summaries of the health, condition, &c., of the villages inspected have been extracted from the reports on the subject submitted by the Deputy Sanitary Commissioners and Superintendents of Vaccination for the year under review.

267. METROPOLITAN CIRCLE.—*Dr. ffrench-Mullen, Officiating Deputy Sanitary Commissioner.*—This officer's sanitary inspections extended over 341 villages and seven towns, situated in the districts and thanas named in the margin, which he visited during the four months of the working season commencing from the 1st of December, during which he was in charge. The subjoined observations, taken from his report which has been carefully drawn up and contains much information of value, relate to these villages. *Habits of the people*:—Dr. Mullen's experience does not accord with those of other sanitary officers, who say that the villagers keep their houses and their surroundings in a filthy condition. He reports that the natives of Bengal are not naturally dirty, but on the contrary their habits are essentially clean. Each villager keeps his bari and its surroundings clean and tidy. The refuse heaps are removed to a considerable distance away, and as such refuse is used as manure for the fields, they are not of a very objectionable nature. But the habits of not keeping the spaces between the baris free of

superfluous vegetation, the village paths and drains in good order, and, above all, the drinking water protected from pollution, he considers a racial defect, but certainly not due to filthy habits. Regarding the Mahomedans, he says that they like to surround themselves with forest, their object being, he supposes, "to hide more effectually their wife-slaves from the world's view." *Water-supply.*—He suggests under this head that, where in a village two tanks of equally good water are situated in convenient proximity, steps should be taken to prevent the villagers from using both indiscriminately; that where the water is deficient, either the zemindar or Government should encourage the excavation of new tanks, by defraying a portion of the required expense, as the zemindar not only declines to help his ryots who, it should be stated, understand the necessity of, and are desirous of having pure and wholesome drinking water, but also prevents their digging a tank at their own expense, unless a *salami* is paid to him. Dr. Mullen adds that such tanks should be dug outside the boundary of the village, as he observed that tanks so situated were invariably clean, and that the villagers using the water of such tanks enjoyed comparative immunity from cholera, and, to a less extent, from fever. *Food-supply.*—The distress caused by scarcity of food appears, from Dr. Mullen's reports, to have been pretty general in his circle; but in Nuddea generally, and in the country about Dumjoor in Howrah and Jehanabad in Hughli, the people seemed to suffer severely from the effects of successive bad harvests, and in the latter place only did the people show signs of being insufficiently fed. He continues:—"I am inclined to believe that in ordinary times the Bengal peasants have a sufficiency of food, but that in many parts of the Province a bad harvest means actual want of the common necessaries of life to the poorer villagers until the next good harvest. The number of people who pass their lives in this precarious condition must be very considerable, and deserve the consideration of the Government as to the best means of removing the causes which lead to frequently recurring periods of scarcity among them. Irrigation appears to me to be the only means, and to be a sure remedy for the evil. The cutting of canals through tracts of land where natural irrigation is deficient would have the effect, not only of making the fields through which they passed more fertile, but would also afford an ample supply of water for drinking purposes." His further observations go to show that, while in many villages visited by him, even in villages where the complaint of distress was great, he found the children plump, and the women, to all appearance, fairly fed; while the adult male population was, as a rule, in a lean condition, evidently the result of hard work rather than of insufficient food. *Education among the masses of the people.*—I cannot refrain from recording here the graphic and useful observations of Dr. Mullen on this subject. He writes:—"The apathy and want of enterprise shown by the generality of the villagers with regard to their own material advancement is, to say the least, disheartening. They seem to consider life a burden, and to be quite unable to make an effort to improve their material condition. The certain remedy for this state of matters is education, and personally I look upon the spread of education amongst the masses of the rural population as the only means of lifting them out of their present lethargic state. No one who converses with the bright, quick-witted village child, then turns to speak to that child's stupid, illiterate father, can help deploring the large number of children now growing up in the villages of Bengal whom a little education would make capable of enjoying existence, but who are doomed to perpetual ignorance, with the result that they will pass their lives like their parents, incapable of healthy enjoyment and useless to the community at large. An enormous amount is being done by the Government in this matter, but the zemindars and other independent natives, who should help the Government to make its work in educating the peasants as complete as possible, seem to take little interest in their illiterate fellow-countrymen, for, as far as I was able to observe during my tour, the village schools or patshalas which receive any kind of aid from these gentlemen is insignificant in number." He also observes that the villagers are, moreover, alive to the dangers to be feared from insanitary conditions, but if left to themselves they will do nothing in the way of improvement. It is a mistake, he says, to suppose that the Bengal peasants resent any interference of Government with regard to matters concerning their every-day life, for

"on the contrary they feel pleased and gratified when the Government shows its interest in them by interference which is directed towards their advancement, and which they can understand is meant for their good, even when a certain amount of inconvenience to themselves is the result. I have no doubt that the extraordinary success which has attended the determination of the Government to vaccinate the whole of this conservative body is due to the high sense of gratitude which they feel towards a Government which takes so much pains to protect them from the scourges of a single disease." In a patshala in the village of Telegram, in thana Jehanabad in Hughli, he found eight pupils—one a girl—engaged in studying a little Bengali book called "*Sharir Palan*," or "How to preserve health," by Baboo Jadu Nath Mukerjee. It begins well, he says, by explaining the necessity of keeping the body clean; and it occurred to him that some Government aided primary schools might follow the example set by the Pundit of the patshala, as such a text-book as the *Sharir Palan* is infinitely more desirable for little boys and girls than most of those he has had an opportunity of hearing pupils read from, and which seem to consist largely of stories of little boys who stole, &c., &c. *Disposal of the Dead.*—Dr. Mullen notes that in certain localities in his circle the Bagdis and other low castes of Hindus only partially cremate their dead, and that when this is done on the banks of a river the body is cast into it and floats away; but that when it is performed on the fields, outside the village, the partially cremated body is left to be devoured by dogs and jackals. *Municipalities inspected.*—Dr. Mullen inspected the Municipalities noted in the margin, and submitted reports regarding their sanitary conditions after visiting them. Such of his observations in his reports as called for notice were forwarded to the Chairmen of the Municipalities concerned for the necessary action. He found that the Commissioners in every Municipality thoroughly realized the responsibility of their position, and were keenly desirous of improving the sanitary conditions of the towns committed to their charge; but he was in no case satisfied with their state, the most glaring offences against sanitary laws being allowed to exist unchecked. For instance, in Kumarkhali the public latrines, which are of the most flimsy construction, are never cleaned; in Ranaghat the banks of the principal municipal tank was covered with human excreta; in Meherpore, with its largely attended market, there is no such thing as a public latrine; in Santipore the Commissioners were found disputing about the propriety or otherwise of re-excavating an old tank, while that portion of the town which is farthest away from the river or any other source of pure water was suffering from want of it, which the provision of a few municipal wells would remove. Drainage was defective or nil in all the Municipalities, the drains, where they exist, being obstructed and eventually leading into some tank or excavation, thus contaminating the drinking tanks by sewage and decomposing vegetable matter. The rain-water collects in basins by the roadside or in excavations, which abound everywhere, or disappears by soakage into the earth, "leaving the organic matter it contained to become the generator of malaria and other poisonous vapours." Of the Suburban Municipality Dr. Mullen speaks thus:—"It clearly is impossible to give even an approximate notion of the filthy state of many of the bustees in this Municipality. The tanks receive the surface washings of every side, mixed with human excreta and other pestilential organic matters, so that the water they contain is utterly unfit to be used for drinking and culinary purposes. The public latrines cannot meet the demands made upon them, so the vessels overflow, and they become a nuisance to the surrounding inhabitants, even when regularly cleaned. The private latrines are not always regularly cleaned out, and are often built in dangerous proximity to tanks. The Goala bustees seemed to be islands amid seas of decomposing cowdung, while the cowsheds are so crowded that no two cows can lie down at the same time. The roadside drains fail to carry off the filth which flows into them, and which consequently collects in pools, which often are extremely offensive. Then the washings from the different tanneries are not properly disinfected, so that the drains which, from an absence of proper levelling, make unsuccessful effort to carry them off

Suburbs of Calcutta.	Santipore.
Baraset.	Meherpore.
Ranaghat.	Kumarkhali.
Kushtea.	

are a great nuisance to the inhabitants on account of the intolerable stench they give forth. Until the Goala sheds and tannery establishments are removed elsewhere, and until they are supplied with pure water conveyed through a system of pipes, it is idle to expect that the sanitary condition of the Suburbs will be anything approaching to perfection; but the principal evils complained of are, without doubt, due to a want of proper supervision on the part of the Municipal Commissioners. With little or no extra expense, and without introducing any sweeping changes such as I have indicated, the Suburbs could be made at least fairly clean. Therefore, the Commissioners responsible for their present pig-stye like condition, should be compelled to do their duty without further delay." Dr. Mullen observes that it is a pity that the large sum allotted for the sanitation of the Suburbs is not utilized, and that if nothing was done for conservancy, he doubts whether its condition could possibly be very much worse than it is.

268. *Assistant Surgeon Umesh Chunder Ghosh, Deputy Superintendent, first Circle.*—This officer inspected, for sanitary purposes, 284 villages and eight Municipalities in the districts and thanas marginally named, in 3½ months from the middle of December, when he joined his appointment on the late Deputy Superintendent, Assistant Surgeon Neem Chand Gupta, being transferred to the Medical Department of the service. The noteworthy facts contained in his report are the following:—*Water-supply.*—Under this head he observes that in some cases villagers have to walk two or three miles for a *culsi* of good water; but as this entails much labour and loss of time, which might be profitably employed otherwise, they are obliged to content themselves during their whole existence with the village water, which is insufficient in quantity and bad in quality. In these villages also the zemindars demand *salami* for permitting their ryots to provide tanks for themselves. In the Bongong sub-division the water of the Ishamutti river is contaminated by the throwing of dead bodies into it:—*Disposal of the Dead.*—This officer says that 99 out of every 100 Mahomedans to whom he pointed out the evils of interring in or near their homesteads, replied that they could not bury their dead in a place not belonging to them; but that if Government gave them a plot of ground outside the village they were quite willing to bury there. In this matter the zemindars should be induced to render assistance. In the Baraset sub-division, although there are burial-grounds in many villages, the people consider it their duty to bury their dead parents near their houses, and they do so accordingly. *Municipal Inspections.*— Of the eight Municipalities inspected by this officer, only the sanitary condition of the South Barrackpore Municipality was comparatively good. There the drains appeared to serve their purpose; the people residing near the river drank its water, some used filtered water from pipes, and the rest tank water; the Mahomedans inter their dead in fixed burial-grounds, and the Hindus cremate on the river side; but there are no public latrines. In the other Municipalities the usual sanitary defects, some of them of a grave character, were found to exist under the head of conservancy, drainage, water-supply, disposal of the dead, &c. *General Health.*—The general health of this circle was reported to be, on the whole, good; but it was noticed that many persons in the Baraset sub-division and Municipality were suffering from fever and enlargement of the spleen.

269. *Assistant Surgeon Preumber Nath Mitter, Deputy Superintendent, second Circle.*—This officer took charge of this circle on the 26th November. The former incumbent, Assistant Surgeon Kasi Chunder Dutt, left it on the 19th May to join a civil medical appointment. Practically, therefore, no sanitary inspections were made during the period between the above-mentioned dates, it not being deemed expedient to fill up the appointment

during the recess. Assistant Surgeon Preumber Nath Mitter inspected, during his incumbency, 802 villages situated on the districts and thanas marginally cited, and his observations, which have been carefully, intelligently, and exhaustively made, relate to these villages. *Soil.*—Under this head he considers the nature of the soil in Birbhum and Murshidabad, and points out the crops which it can raise, its usefulness or otherwise for house building, and that large tracts of land are lying uncultivated in thana Mouressur, in Birbhum and in thanas Gokurn and Goas in Murshidabad. *Roads*—Are the crying want in every part, excepting in Municipalities. Many are out of repair, and some of lower level than the paddy fields on either side. In the Nuddea district several roads have been breached or damaged by the floods or are in want of repairs. Thanas Goas and Bhugwangola in *Murshidabad* abound in jungle, and the jungle even in the villages is so dense as to harbour wild animals to the great terror of the people. *Drainage.*—Want of drainage is said to be the most unsatisfactory feature in the sanitation of the *Nuddea* and *Murshidabad* districts, and its effect is seen in the bad health of the people when rain is not attended with flooding from large rivers. *Water-supply.*—Scarcity of water is grievously felt in most parts of *Murshidabad* and *Birbhum* in the dry season, the people loudly complaining of this want. The tanks being few in number are insufficient for the requirements of many villages, or are altogether wanting in some, and, with few exceptions, are shallow, and many of them require to be cleaned out. *Disposal of the Dead.*—The pauper dead are still cast into water-courses in some parts of thana Bhugwangola in *Murshidabad*. *Inundation and scarcity—Birbhum.*—The deposit of silt by the overflow of the Moyurakhi river is said to have materially assisted the cultivation of the *rabi* crops, which were better this year than during the past three or four years. It was observed that thana Bolepur is, owing to its natural water-courses, vulgarly called kandars, advantageously situated for irrigation, and hence the outturn of paddy was better than in the other thanas. The people in the Mouressur and Nulhati thanas suffered much from scarcity of food, the result of insufficient or untimely rains. In the latter thana relief works had to be improvised. *Murshidabad.*—Here the floods added to the distress already experienced owing to three successive years of deficient harvest. *General Health*—Was better in all the three districts than during the three preceding years. Thanas Nulhati and Dubrajpur in Birbhum kept better health than the other thanas, owing, it is said, to their being hilly. Thana Bolepur in the same district is said to have been much depopulated by the malarious fever which prevailed severely in it a few years ago, and is still lingering on in villages comparatively free from dampness and jungle. The Kushtia thana in *Nuddea* was more free from fever than the rest of the thanas.

270. *Assistant Surgeon Jadub Chunder Ghose, Rai Bahadoor, Deputy Superintendent, third circle.*—This officer was in charge of this circle throughout the year, excepting from the 20th to the 30th November, when he officiated as Superintendent. His inspections extended over only 52 villages situated in the districts and thanas named in the margin, and the following abstracts taken from his observations relate to those villages. *Drainage*—Is very defective in all the districts, and in Burdwan there is none, but this, according to this officer, does not affect the health of the people, as

the villages are situated on high land having a natural drainage. *Inundations.*—The Deputy Superintendent reports that he has closely observed that the inundations in his circle did not affect the public health injuriously, the people enjoying as good health as in any previous year, although a "good amount of vegetable decomposition was going on in every side." *Water-supply.*—Burdwan possesses some large tanks. They contain good clear water, but some of them are fouled by bathing and washing in them and defœcation on their banks. The excellent water of the Roopnarain river cannot, it is said, be used by the people living along it, for fear of the crocodiles which abound in it. *General health* was pretty fair in this circle.

271. *Assistant Surgeon Ashootosh Law, Deputy Superintendent, fourth circle.*—This officer was nominated to this circle during the year, and he joined the appointment on the 26th November. He inspected, for sanitary investigations, 564 villages situated in the marginally noted districts and thanas, and the following notes have been taken from his report, which, it should be stated, is rather meagre in observations other than ordinary. *Water-supply.*—In some villages stones are put around the mouths of the wells about a foot high, and in some earthen parapets are raised around them, to prevent pollution of the water. *Conservancy.*—One reason why the privies in the mofussil cannot be attended to is said to be that the superstitions of the people will not permit them to have a mehter living amidst them as a neighbour. *Towns inspected.*—This officer also inspected the towns of Tumlook, Chunderkona, Khirpai, and Ramjibunpur in Midnapore, and the Bissenpur town in Bankura. The sanitary condition of all of them, excepting Tumlook, was, he says, more or less bad. *General health*—Was, on the whole, good, but in the Dantoon and Sudder thanas of Midnapore many people were met with suffering from chronic enlargement of the spleen, attributed to use of foul water.

272. SUBURBS OF CALCUTTA.—*Assistant Surgeon Jogendro Nath Bhuttacharjee, Deputy Superintendent.*—This officer's observations go to show that this Municipality is in a grossly insanitary condition; but as they do not materially differ from those furnished by Dr. Mullen, already submitted above, there is no need of repeating them here. It should, however, be recorded that from his report it appears that a new bustee called Kabidangah is being formed in thana Garden Reach, but that for its formation the people are digging earth, and thus creating excavations, which will in the future become cess-pools of stagnant water, containing decomposing animal and vegetable matter; that the Haripara bustee in Entally with its inefficient and exposed privies has been recently burnt down, and that it is hoped that in reconstructing it care will be taken to avoid the insanitary conditions which obtained in it; that the Goala bustees in Baliaghatta and Haldarbagan are simply pools of decomposing cowdung and straw, the drains and the excavations which have been made to receive them, being full to the brim, and that promiscuous defœcation is general for want of free public latrines. The Deputy Superintendent's inspections lead him to remark that "it is disgraceful, to say the least, that the Metropolis of British India should be surrounded by bustees whose sanitary condition is utterly neglected."

273. DARJILING CIRCLE.—*Dr. J. J. Wood, Deputy Sanitary Commissioner.*—This officer's sanitary inspections extended over 200 villages in the districts and thanas named in the margin. The following notes represent the principal observations made by him. *Roads.*—Many roads in the districts visited, especially those forming traffic lines, require to be planted with trees. *Water-supply.*—In addition to the usual sources of pollution, elephants, buffaloes, and other cattle are washed, bamboos steeped, and dead bodies of men and animals left in the tanks, bhils, and

rivers, and it was noticed that even the cleanest kept tanks were used for bathing, &c. *Disposal of the Dead.*—Burials in or close to houses and on the banks of tanks and rivers were observed to be common; and with regard to cremation, it was a rule to throw the ashes if the body is fully cremated, or the body if half cremated, into jhils, rivers, or tanks; but the people said that, excepting in the case of rivers, the water of the reservoirs thus contaminated is not drank. *General health.*—The general health of the circle is stated to have been much superior, as a rule, to ordinary years, fevers being less in the majority of the villages. *Advice offered.*—Besides instruction in the villages, Dr. Wood consulted with, and advised in sanitary matters, the native doctors whom he met, eliciting from them at the same time information relating to the villages.

274. *Moulvie Tujumul Hossein, Deputy Superintendent.*—This officer inspected 109 villages in the districts and thanas cited in the margin. The following facts taken from his notes may be given. *Site of villages.*—Many of the villages in the districts visited are situated on the banks of rivers, and generally villages are sparsely populated. *Water-supply.*—In the Dinajpur district some tanks are reserved for drinking purposes, and many wells protected by fencing. *Disposal of the Dead*—It was noticed that in many places, owing to the village sanitation rules having been enforced, and to the watchfulness of the police, the throwing of corpses into the rivers has ceased; and that nearly all the Mahomedans have special places for interring their dead.

275. *Assistant Surgeon Norendro Nath Gupta, Deputy Superintendent.*—This officer inspected 64 villages and 2 towns situated in the districts and thanas marginally named, and the following observations are taken from his report. *Population.*—Under this head it was noticed that the habits of the people in these districts are simple; that they are quite contented with poor diet, consisting of coarse rice, any sort of dâl, and some vegetables; that the men, as a rule, are averse to labour. *Water-supply.*—In Rajshahye the fishermen place large bamboo baskets filled with branches of trees, called *Kata*, in the rivers for catching fish, with the result that the water smells badly, and becomes muddy when the baskets are taken out. The impurity of this water is intensified when the rivers become stagnant during the hot months. *Advice tendered.*—Under this head it is observed that in all places the villagers assembled to hear eagerly the instructions given to them, but that they pleaded that, owing to poverty, they could not carry out the suggestions, and asked for Government aid in the matter. *Suggestions.*—The Deputy Superintendent states that some law framed on the same principles as those which apply to cultivable land is necessary to compel zemindars to give land to the villagers for burial-grounds and tanks, as the villagers say that they can dig tanks at their own expense, provided they are exempted from the exactions made by the zemindar for liberty to dig tanks.

276. RANCHI CIRCLE.—*Dr. L. A. Waddell, Deputy Sanitary Commissioner, Ranchi Circle*—Enquired into the sanitary condition of 281 villages situated in the districts and thanas named in the margin, and the following observations taken from his carefully drawn up and excellent report apply to these villages. *Lohardugga—Water-supply.*—The chief source of water-supply in this district is the "dari." The

dari is essentially a natural spring and not the surface drainage collected in a hole dug in a rice field, or in the cavity formed by banking up a rice field, as explained in the last year's Report. At the point where the water issues from the spring an excavation is made by the villagers to allow of their filling their vessels. This shallow "dipping well," in contradistinction to a "drawing well" is usually brimful, for these springs are mostly perennial. Referring to the quality of this water, Dr. Waddell says:—"The association of daris with rice fields, although so common, is purely accidental, there being no necessary connection between the two. Rice is the staple crop throughout Lohardugga, and it is grown on each and every piece of ground where the moisture necessary for its growth can be obtained. As natural springs are common on the Lohardugga plateau, the moist tract of land lying below the spring is specially indicated for rice cultivation, and as a consequence not only this moist land below the spring, but (so as to utilize every inch of moist soil) the land immediately surrounding the dari is terraced into rice *khets*. The position of a dari in a rice field tract is thus characteristic. It is usually just within the margin of the terraced rice field tract; and below the dari stretches the terraced area of more or less sodden rice fields, dependent on the dari for their moisture. It will thus be seen that it is the dari with its outflowing moisture which determines the rice fields. The quality of dari water is, in most cases, extremely bad, from the practice of terracing the ground which includes the dari, and damming up the margins of the *khet* thus formed retards the outflow from the spring, and besides the water in the dari frequently becomes continuous with a small pool of water in the sodden field outside. Moreover, the shallowness of the well and its being brimful renders it liable to be frequented, and therefore polluted by cattle. To guard against this, the outer shell of the burned out trunk of a tree is frequently inserted into the well, so as to project several feet above the surface, and form in this way a wall. This, however, succeeds to a very imperfect extent in limiting the pollution of the water." There is another source of water-supply in Lohardugga called the "*Chimhi.*" This consists of a shallow excavation in the sandy bed of a small stream. The water percolating through the sand into this excavation is fairly good in quality, when, as frequently happens, the sand is comparatively free from organic impurity. In the Palamow sub-division the rivers and streams from which the water-supply is derived were found in an extremely insanitary condition. *Hazaribagh.*—In this district the water-supply, which is taken from kutcha wells, is very bad, particularly in the north and north-east, where opium is the principal crop grown. These wells, which exist in vast numbers in the neighbourhood of every village, and which are primarily constructed for irrigating the poppy crop, are highly contaminated by the manure, consisting of half rotten house-sweepings and refuse and cattle-droppings employed in the cultivation, owing to its being thickly strewn on the fields immediately around and between these wells, the soil being generally and highly porous. This so-called manure does not only pollute the water-supply in the fields, but it affects the health of the people, by being hoarded up in the immediate neighbourhood of their houses or against the house-wall, or in shallow excavations near the houses, and kept there till leisure permits of its removal to the fields, or till the quantity accumulates to such an extent as to demand removal. *Singbhum—Dwellings.*—It is gratifying to learn that the condition of the villages inhabited by the Larka Kols or Hos in this district is better, so far as they were seen by Dr. Waddell, than is generally the case. They present a remarkably clean appearance, due to the regularity with which the huts are built. These huts being made of spliced bamboo interlaced together, with roofs of thatch, allow of free ventilation, and altogether are not ill-adapted to the climate which is never very cold. On the whole, these villages are cleaner than those of the Uroans and Mundas inhabiting the Lohardugga plateau. *Disposal of the Dead.*—The practice of burying semi-cremated remains of the dead in the immediate vicinity of dwellings is universal, but the evils resulting from this practice is lessened by the fact that the fleshy parts of the body are mostly removed before burial, and that only a portion of the uncremated remains is selected for actual interment. *Water-supply.*—In this district the water-supply is taken from kutcha wells and daris and occasionally from streams and rivers, very rarely from tanks. It is limited in quantity during the greater part of the year in places away from the rivers. *Conservancy.*—The heaping up of

house-sweepings, refuse, &c., is also prevalent in this district; but the nuisance, although great, is less in degree than that referred to above as existing in the Hazaribagh district, as the Hos villages are smaller, and the fields in which the manure is spread are not wholly situated in the immediate neighbourhood of the houses. *General health* seemed on the whole fair. It was observed that in thana Tamar and Basia off the plateau in *Lohardugga* a considerable number of the people had malarial cachexia. In *Hazaribagh* the general health of the villagers was found to be below par, and as a class they appeared badly nourished. This, it is believed, is in some measure due to the impurity of the water they drink, and the tainted atmosphere in which they live from causes above explained. It was noticed that the Sonthals inhabiting jungle tracts near the Burrakur river and its tributaries were in bodily health much superior to the people who cultivate opium, living not far distant. In *Singbhum* numerous cases of itch among the children were met with, which Dr. Waddell thinks may, in some measure, be dependent on neglect of personal cleanliness, due to scarcity of water. *Recommendations.*—Under this head Dr. Waddell makes the following sensible suggestions which deserve consideration :—As little action is taken by the villagers on the suggestions of the Vaccination Department on matters relating to village sanitation, he is of opinion that "more practical good might be effected and solid advance made were the authorities to limit, for the present, their sanitary efforts to the securing to the people a *supply of pure drinking water.* This is the *prime sanitary necessity* for every village throughout the whole circle; and it is only to be supplied by authority acting from without the village communities. Good pucca wells ought to be constructed in every village on suitable sites; existing wells and tanks which are thoroughly bad should be filled up; and the remainder properly cleaned; and once a good drinking water-supply is obtained, thoroughly satisfactory arrangements must be made to conserve the water against pollution."

277. *Assistant Surgeon Prosonno Coomar Dey, Deputy Superintendent.*

This officer's sanitary inspections extended to only 60 villages in the districts and thanas named in the margin, 37 of which were inspected in company with me when I visited them on special duty, so that only 23 villages were made by him the subject of independent sanitary observation. I agree with Dr. Waddell, the Superintendent, that this is an insufficient number, considering that stringent orders were issued for more extensive inspections. *Roads.*—The village roads are said to have never undergone any repair; many are obstructed with heaps of cattle dung, and some are used as privies. This was notably the case in Nadiara, a part of the Raghunathpore union. *Water-supply.*—There are no good tanks in some of the chattis and villages on the Grand Trunk Road. The water-supply in villages Bagmundi, Mohal, and Adardir in Manbhum, and in 9 out of every 10 of the Kolhan villages is notoriously insufficient and bad. *Suggestions.*—That Rughunathpur and Jhalda should again be created Municipalities, as since their abolition as such the observance of all sanitary arrangements has ceased, and their sanitary condition is deteriorating; that the Police should be directed to prevent people from defœcating in the river bed in Bagmundi; and that the Mankis and Mundas of Kolhan should be induced to provide at least one good well in each village.

278. SONTHAL PERGUNNAHS CIRCLE.—*Assistant Surgeon Kashi Nath Ghosh, Deputy Sanitary Commissioner.*—This officer inspected 341 villages situated in the thanas and districts named in the margin, and the towns of Rajmehal, Sahibganj, Colgong and Deoghur. His report is exhaustive and indicates that he bestowed much attention on his sanitary inspections. His observations go to show that the insanitary conditions common

In Monghyr.

to the villages in Bengal obtain also in the rural towns and villages visited by him; so to avoid repetition and lengthening this Report, I omit them, recording only a few of the most glaring defects on the one hand, and some redeeming points on the other. *Monghyr.*—In village Burhaye, in thana *Surajgurah*, the Mahomedans bury their dead in close proximity to their houses. In the rural town of *Jamui* many of the wells are pucca and surrounded by parapets, but they are used for all purposes; most part of the private privies are well-privies, but the few surface ones are regularly cleaned, and the night-soil removed to the adjacent fields, and the Mahomedan dead are interred in plots of waste land two miles distant from the town. In the rural town of *Sekundra* the greater number of the houses are used as shops. They are open only in the front facing the road, all the other sides being perfectly closed and air-tight; the whole town is devoid of the means of proper ventilation and perflation of air; the pauper dead are thrown into the rivulet Tukni, or buried in its sandy bed; but the water of this rivulet is said not to be used for drinking. The Mahomedans, however, bury their dead in a plot of waste land a mile from the town. The town of *Shaikpura* is pronounced to be the most insanitary and filthiest of towns in the district of Monghyr. Although a large town, its situation, the arrangement and construction of the houses, the nature of the pathways are such that all recommendations referring to sanitary reforms would be altogether useless, unless the town is thoroughly remodeled. The whole town is thickly populated and overcrowded, and conservancy is entirely absent, and there are no means for removing the sewage and refuse matter which are accumulated in the backyard of every house. It is drainless. The water drains from the adjacent hills and brings with it human excreta and all descriptions of filth. The wells which are the only source of water-supply are, for the most part, kutcha and unprotected, and their water is very filthy, and the water-supply is, moreover, insufficient. There are well-privies in many houses which are never cleaned. It has been observed that when cholera or small-pox breaks out any where in thana Shaikpura, it is sure to appear first in this town. The water of a tank in village *Kamasi*, in thana Shaikpura, is polluted by refuse from the tanneries of the resident Chamars, although it is used for drinking purposes. Most of the people of the villages in thana *Chakye* are unmindful of cleanliness, and are insufficiently clad, but the redeeming features among many other insanitary conditions are that the sweepings and house refuse, although accumulated in the courtyard, are burnt at intervals, and that the cattle are kept in temporary sheds in the winter, and under the shade of large trees in the summer. *Bhagulpore.*—In thana *Sultangunge*, in this district, the Hindus throw their dead into the river, and the Mahomedans bury theirs in its banks. In the *Bilbur* town the inhabitants appear to be in more or less easy circumstances, and their dwellings are for the most part mud-walled and tiled-roofed. Cholera raged in most of the villages in thana *Umerpore*, in epidemic form, from July to September, and was attributed to their insanitary condition. The drainage is defective, the water-supply bad and polluted, conservancy absent, the houses insufficient and ill-ventilated, and in most cases the people are destitute and insufficiently clad. In thana *Soopole* the houses are either mud-walled or fenced with a kind of reed called *foos*, and their floors are, as a rule, raised and free from dampness; but owing to the other sanitary arrangements being bad, cholera raged in it from October to December. *Sonthal Pergunnahs.*—In the villages of Debipur, Kandha, and Kupria, in *Deoghur* the well water, which is used for drinking purposes, is good, and the dead are burned or buried in the jungle near their neighbourhood. In the village of Gomala in *Jamtara* the houses are mud-walled, and their roofs thatched with straw, and some of them are well ventilated; and the drinking water taken from a tank is of good quality and not polluted in any way. In the villages in the *Rajmehal sub-division* and in thana *Mohespur*, the paddy-fields become sheets of water during the rains, but the water is gradually and completely drained away by the small rivulets which flow through them, so that the country is dry even before the cold weather sets in; but the people are, for the most part, indigent, insufficiently clad, and negligent of personal cleanliness, and cooking is carried on, and the sheep, pigs, and goats are located in the bed-rooms in most of the villages. The people in the villages of *Rajmehal Jabdi* appeared to be laborious,

cheerful and healthy. They subsist, irrespective of the ordinary grains, on a kind of wild corn which grows plentifully on the hills, and do not hesitate to eat the flesh of any dead animals. Wood from the jungles being plentiful, the dead are cremated completely. The sanitary condition of the four towns visited by the Deputy Sanitary Commissioner is reported to be bad, that of Rajmehal being the worst, without hardly one redeeming feature; but in Deoghur the natural drainage is excellent, so much so that its remarkable healthiness is attributed to it; most part of the houses are brick built, but crowded together and ill-ventilated; one of the tanks has been set apart exclusively for drinking purposes, and some of the wells are reported to contain pure and wholesome water, and the conservancy arrangements are fair. *Registration.*—The Deputy Sanitary Commissioner reports that the verification of death registration in the villages of his circle is very difficult. The people, besides being ignorant, are unwilling to afford information, as the village chowkidar is in the way, and it is particularly in the presence of the chowkidars that the punchayets hesitate to give information. Moreover, his subordinates, even if they find any discrepancies, are reticent in reporting them for fear of incurring the displeasure of the police, and hence they take no interest in the matter, and perform this duty in an evasive and perfunctory manner. He had reason to believe that on several occasions the reports they made were simply copies of the thana register. He therefore directed them to report only such deaths as were not reported at the thana by the chowkidars, but the order does not appear to have been generally obeyed. *Suggestions.*—Of the recommendations made by the Deputy Sanitary Commissioner, the following deserve consideration. Reservation and protection from pollution of the sources from which drinking water is taken; setting apart waste lands for defæcation; selecting plots of land and fixing them solely as burial-grounds; and converting the Shaikpura town into a Municipality.

279. BEHAR CIRCLE.—*Assistant Surgeon Mothura Nath Sen, Deputy Sanitary Commissioner.*—This officer's sanitary inspections embraced 440 villages situated in the districts and thanas named in the margin. The chief of the observations made by him were the following: —*Houses.*—Overcrowding of inmates in houses at night is general, but their mud floors are dry, excepting in the rainy season. The cattle sheds, although close to the dwelling-houses, are daily cleaned. *Roads.*—In the Patna district many roads have been constructed by the Road Cess Department, so that all the police stations are connected with one another, and in the Dinapore sub-division many fair-weather roads have been provided connecting one village with another. Trees have been planted on the sides of some of these roads, but they have died off. Trees on the metalled roads in Shahabad are, however, thriving well. *Water-supply.*—Well water is used every where, except in some villages which are situated on the banks of the rivers Ganges and Sone. Tanks are comparatively few in number, and their water is never drank. The wells are situated on high ground and protected from inward drainage, but their water is not above suspicion. *Conservancy.*—In these districts cowdung is dried and extensively used as fuel. In the outskirts of Futwabazar a few of Major Ramsay's portable latrines have been placed, but they are not generally used. Most of the private privies in the villages are sundasses or well-privies. In every village there are pits or holes in which water stagnates almost all the year round. *Disposal of the Dead.*—Interments and cremation generally take place at a safe distance from the village boundaries. *General health.*—The general health of the circle was, on the whole, good, but in the Shahabad district fever prevailed with unusual severity. All the thanas suffered to a more or less extent from its effects, and in the low-lying tracts it is believed that scarcely any person escaped it. The greatest suffering from the disease was experienced during the months of September and October. From the beginning of November, however, fresh attacks were few, but relapses, attended with the usual complications, were frequent. *Registration.*—It was noticed that the chowkidars when they come to know that enquiries regarding deaths have been made in their villages

by the officers of the Vaccination Department generally register the omitted death after the enquiry, and in some case hide the information in such a way that it takes much time and trouble to bring it into light. To check these malpractices, the Deputy Sanitary Commissioner advocates the introduction of the *hath chitti* or memorandum book system throughout the districts. *Recommendations.*—Under this head may be cited the following. To limit defæcation to the fields outside the villages, and to set apart one or two wells in each village solely for drinking water.

280. ORISSA CIRCLE.—*Apothecary P. Veriah Naidu, Deputy Sanitary Commissioner.*—Visited for sanitary inspections, 1,155 villages situated in the districts and thanas marginally named. His report deals with the chief of these villages, and while disclosing the existence in them of the insanitary conditions common to all villages, notes the following redeeming features exhibited. The soil is good, the houses are kept clean and are mud-walled with free ventilation, accommodation is sufficient, food and water-supply plentiful, and general sanitary state good. In addition, the following conditions are peculiar to the villages named. In Palirampore, in thana *Kendrapara*, refuse and cattle dung are thrown, and the dead interred and cremated outside the village far from the sources of drinking water. The latter procedure is also observed in Gopalpore and Palaspore in thana *Kendrapara*, in Shahabad in *Jagatsingpore*, in Nursingpore, in Tirtol, in Mungulpur in *Dharmsala*, in Locknathpore in *Jajpore*, in Jaha, Bhimrajpur and Muttasai in *Cuttack*, and in Gobindpore in *Salipore*, and the former process in Issurpur in *Cuttack* and Bulrampur in *Salipore*. Dondapa in *Patamundi* is surrounded by swamps, and the houses in it are ill-ventilated. In Kussipore, in the same thana, the houses are kept very dirty, and personal cleanliness is much neglected. In Pamda in *Tirtol* refuse and cowdung heaps are to be met with at every door, and in Meaneyjunga, in the same thana, and in Hajarapatana in *Cuttack* the houses are very filthy and the sanitary condition very bad. In Jobra in *Cuttack* the habits of the people are uncleanly. In Nuahat in *Cuttack* cowdung is heaped in front of houses. In Karimpur in the same thana, in Govindpur and Bulrampur in *Salipur*, and in Polaspur in *Kendrapara*, sewage and house refuse are thrown in the backyards of houses. In Jamadaipur in Cuttack the food and water-supply are insufficient. In the villages of Nuahat Bazar, Bhowpur, and Hajarapatana in *Cuttack*, in Julishurpur in *Patamundi*, in Shabad in Jagatsingpur, and in Painda and Surjet in Tirtol, suggestions for the improvement of insanitary conditions were made to the people or to the headmen of the villages, and they are said to have been "at once remedied." *General health* was good on the whole; but in the village of Dondapore in *Patamundi* fever prevails to a great extent in September and October, "due to malaria;" in the Juldhurpur village in Aul in the winter months due to climatic causes; and in the village of Horidapol in *Dharmsala* during the rainy months due to stagnant khals."

The Deputy Sanitary Commissioner also visited the thanas of Kendrapara, Patamundi, Aul, Jajpur, and Dharmsala in Cuttack, to enquire into the damage which was caused in these thanas by the cyclone and storm-wave which occurred in September. A brief account of this calamity has been furnished in paragraph 38 of this Report. From Mr. Naidu's observations it appears that 5,570 villages were affected; 166 villages almost or entirely swept away with their inhabitants; several thousands of trees and bamboo bushes were uprooted; large quantities of paddy, rice, and other edibles were destroyed or damaged, and much destruction or damage done to property. The ascertained loss of human lives amounted to 2,342, and of cattle to 13,003; but he estimates that over 10,000 of the former and 15,000 of the latter perished.

R. LIDDERDALE, M.D.,

Deputy Surgeon-General,

Sanitary Commissioner for Bengal.

The 28th June 1886.

APPENDIX No. I.

VITAL STATISTICS OF THE DISTRICTS IN BENGAL

R. LIDDERDALE, M.D.,
Deputy Surgeon-General,
Sanitary Commissioner for Bengal.

APPENDIX No. III.

SUMMARY OF SANITARY WORKS, IMPROVEMENTS, &c., CARRIED OUT IN TOWNS AND DISTRICTS.

DURING THE YEAR 1885.

Summary of the Sanitary Works, Improvements, &c., which were carried out in the Towns and Districts of Bengal during the year 1885.

IN TOWNS.

In Burdwan District.—*Burdwan.*—Rupees 39,980 expended for completing the water-works. *Cutwa.*—Strand road new metalled, cost Rs. 299; three lanes constructed Rs. 66; and pucca culverts on Nuniagola road supplied for effective drainage, Rs. 53. *Dainhat.*—Culverts supplied to Kalikabodi and Tamlipara roads for more effective drainage Rs. 22; and pucca side drain for the sudder road in progress. *Culna.*—Five arched and 4 planked culverts supplied to different roads for more effective drainage, and a pucca drain constructed at Mehal road, Rs. 211.

In Bankura District.—*Bankura.*—Two pucca drains and two culverts constructed, cost Rs. 513; and a latrine at Kuchkuchia in progress. *Bishenpur.*—Roads, a bridge and stone culverts constructed, Rs. 489; and roads and pucca drains in progress.

In Birbhum District.—*Poori.*—A filtering drain for the kutchery tank and a shed for the conservancy carts and bullocks constructed, Rs. 231 and Rs 45 respectively.

In Midnapore District.—*Midnapur.*—Rupees 557 expended in constructing roads, Rs. 820 in cutting new drains and bunding up the central drain, and Rs. 264 in draining out or closing foul tanks. *Tumlook.*—The main and Municipal markets newly metalled, Rs. 853, and a masonry building for Municipal market constructed, Rs. 701. Material improvement is said to have been effected by the latter work, and *Ghatal.*—A privy constructed for the hospital, Rs. 100; and roads and a hospital building in place of the old one which had been demolished by the earthquake in progress. *Chundrakona.*—Two new roads constructed, Rs. 36; and excavation of a tank and construction of two roads in progress. *Ramjibanpore.*—Two new roads constructed, Rs. 74, and two in progress. *Khirpai.*—Roads, culverts and bridges constructed, Rs. 152; a tank excavated with a view to supply good water, Rs. 200.

In Hooghli District.—*Hughli and Chinsurah.*—Four roads and two culverts constructed, cost Rs. 1,653; and 4 roads and 4 lanes newly metalled, Rs. 8,823. Of these roads the most important is the Strand Road, the metalling of which with stone cost Rs. 6,660, two drains and one road, and metalling of a road in progress. *Serampore.*—Drains, roads and 8 culverts constructed, Rs. 2,170; 3,415 feet of roads newly metalled; and two new plots of ground selected for burial of night-soil. *Uttarpara.*—Roads, drains and culverts constructed, Rs. 873. *Baidyabatti.*—Roads and culverts constructed, Rs. 2,216; the waterway increased by laying down Ranigunge pipes, and new metalling of 3 roads in progress. *Bhudressur.*—One pucca latrine built at Beldertooly, Rs. 226, and one pucca road constructed and provided with side-drains at Tolinipara, Rs. 901. *Kotrung.*—Roads and 12 culverts constructed, Rs. 438.

In Howrah District.—*Howrah.*—Four roads constructed, and nine newly metalled, cost not stated. *Bali.*—Roads and lanes constructed, Rs. 1,800.

In 24-Pergunnahs District.—*Suburbs of Calcutta.*—Woolfat Bagar bustee improved Rs. 124; three roads, five lanes and footpath metalled, and one lane protected with posts, Rs. 3,841; and pipe culverts and drain bridges provided to five roads and one lane, and six pipe drains to ward No. II, Rs. 217. *South Suburban.*—Four roads and one lane constructed, Rs. 2,022; and seven roads in progress. *Baranagore.*—Four roads metalled, Rs. 1,357. *Rajpore.*—Thirteen roads and one lane completed, Rs. 1,377; and eight roads, three lanes and nine culverts in progress. *Barripore.*—A pucca water passage to municipal tank No. 2 provided, Rs. 75; four culverts constructed, Rs. 74; and 2 roads newly metalled, Rs. 107. *Jaynagore.*—Three roads constructed, Rs 347. *South Dum-Dum.*—Three roads constructed and three newly metalled, Rs. 2,466. *Baraset.*—Roads metalled, Rs. 3,874, and four large and 20 small culverts constructed, Rs. 500. *Naihatty.*—Eleven roads newly metalled, Rs. 662; two culverts and two bridges constructed, Rs. 207; and metalling of eight roads in progress. *Bussirhat.*—Drainage works proceeded with Rs. 250. *Badurea.*—A dispensary built, Rs 101.

In Nuddea District.—*Krishnagur.*—Two public latrines constructed; two new trenching grounds opened; 109 well-privies filled up; the cutting admitting river water to the former bed of the Anjona improved to admit water to the tanks and swamps occupying the river bed, and to replenish the tanks, Rs. 435; and the tank in the jail compound cleared out, deepened and protected from pollution, Rs. 800. This tank now contains good drinking water, and is open to the public in the north-east of the town, where water was much needed. *Nuddea.*—A road metalled, Rs. 1,439. *Ranaghat.*—Roads and bridges constructed, Rs. 597. *Santipur.*—A tank excavated, Rs. 2,020; survey and level of the town taken, and plan of regular drainage prepared, Rs. 600; 6 roads constructed, Rs. 2,038; 8 culverts put up, Rs. 154; side drains provided to Nootanhat road, Rs. 86; and bunds on the strand road erected to prevent flooding of the town, Rs. 372.

In the Jessore District.—*Jessore.*—Two of Major Ramsay's moveable latrines brought into use, cost Rs. 194; a tank excavated at Sunkerpore, Rs. 1,656; 4 culverts put up in 3 roads, Rs. 279; and a pucca drain constructed at Doralain, Rs. 41. *Moheshpore.*—Five miles of kutcha drains excavated, Rs. 180; 1 mile of kutcha road constructed and one mile of roadway metalled, Rs. 939; 30,000 tiles, a roller and 50 earthen pipes purchased for constructing pucca drains, Rs. 884. *Kotchandpore.*—Two roads with culverts constructed, Rs. 108; and drainage works carried out, Rs. 433.

In the Khulna District.—*Khulna.*—Part of Foolpara road metalled, Rs. 112. *Satkhira.*—A tank excavated in Kitia for supply of good drinking water, Rs. 463.—*Chandurìa.*—Survey and plans of the town for a drainage scheme in progress.

In the Murshidabad District.—*Berhampore.*—Two pucca drains and a pucca drain culvert constructed to improve the drainage, cost Rs. 306; and a channel from the Khagra sluice to the Natial road to flush the Bistopore bhil with river water passing through the sluices in progress. *City Murshidabad.*—A bullock shed constructed with corrugated iron, Rs. 564; and latrines provided at Debipore and Baluchar, Rs. 125; and the Baluchar and Azimgunge drainage scheme in progress. *Kandi.*—Metalling of the sudder road in progress. *Jungipore.*—Two roads and one lane constructed, Rs. 445; and latrines in progress.

In the Dinajpur District.—*Dinajpur.*—Three roads metalled, cost Rs. 3,954 additions made to the sudder dispensary to meet insufficiency of accommodation and to provide a separate ward for cholera patients, Rs. 4,568; a drinking trough for bullocks, and a shed for keeping night-soil carts constructed, Rs. 160; and a latrine at Kashyepara and another at Batitolah in progress.

In the Rajshahye District.—*Beauleah.*—The Meapara public latrine reconstructed cost Rs. 75; main drainage channels constructed; and drainage works in progress. *Nattore.*—Four culverts and a large bamboo bridge over the Narod river constructed, Rs. 671; and the metalling of the Borgacha road in progress.

In the Bogra District.—*Bogra.* One pucca latrine built, cost Rs. 120; and a masonry culvert constructed and three roads newly metalled, Rs. 1,670. *Sherpur.*—One well sunk, Rs. 10, and a road in progress.

In the Pubna District.—*Pubna.*—Land acquired at Raghubpore for Mahomedan burial ground, cost Rs. 273; conservancy cart provided, Rs. 126; 95 Ranigunge pipes purchased for drainage, Rs. 188; bund over the Ichamatti constructed, Rs. 186; and one road metalled, Rs. 916. *Serajgunge.* Ghat constructed on bank of river, Rs. 263; six wells sunk, Rs. 78; silt removed from bed of Khatta khal, Rs. 552; one iron roller for roads purchased, Rs. 608; three bridges constructed on three roads, Rs. 242; and the metalling of the Fanapoti road in progress.

In the Darjiling District.—*Darjiling.*—*Conservancy*:—One two-seated and one four-seated latrines at Bhutea Busti; and two new latrines, one at Jore bunglow and one at Goompahar constructed; a wooden shoot and iron buckets supplied for the wire tramway, and a new cesspool for the Kayas latrine constructed, cost Rs 2,489. 17 private latrines constructed, two by Municipality at the cost of owners; six private latrines demolished on the ground of their being nuisances; and several private latrines rendered efficient at the request of the Municipality. It would prove very beneficial if this procedure were more generally imitated, for the private latrines in Bengal are for the most part wretched structures. The establishment for removing night-soil considerably increased, and the permission of Government sought to use certain lands as night-soil depôts. *Market*:—Three sheds containing 50 shops built at the covered market, which has improved its appearance. This completes the market. *Drainage*:—Lochnagar Jhora extended Rs. 477; a drain from Jhora between Eden falls and Hawk's rest; a drain from jail road to the pound; half of Jeeton Jhora drain; a drain at Butcher's busti; a drain from the servants' quarter of the Town Hall to Mall road; a stone drain through Messrs. Doyle and John White's land near Caroline Villa; a stone drain from Mr. Rosamond's compound to Aucland road; a stone drain in front of the Deputy Commissioner's kutchery, and a wooden drain near Baboo Bhoobun Chunder Haldar's house at Chandmari constructed. These drains cost Rs. 3,252. *Water-supply*:—A line of water-pipes laid on to Butcher's busti and another to Judge's bazar on the cart road, Rs. 916. The pipe line taken under the slaughter-house, Rs. 6. The question of six additional springs for increasing water-supply under consideration. *Building*:—A round-roofed barrack in the central bazar; an additional verandah to the round-roofed barrack in the bazar south of the Hindu temple; two sheds over the cesspools of the serai stables; a barrack for sweepers at Jore bungalow; an additional verandah to barrack No. 8 in Bhojawallaputty; an additional verandah to the round-roofed barrack in the central bazar in front of Jetmall's barrack; a shed for the tramway breaksman at the upper stage. These buildings cost Rs. 2,714. *Arboriculture*:—Two hundred criptomeria trees planted, and arrangement made with the Superintendent of the Royal Botanical Garden, Calcutta, for attending to the work for the next ten years. Seven outlet drains in the native town; a stone drain in the Lobong spur zigzag below Bhutia busti; a stone drain along the Birch Hill road from opposite Rook's Nest to Sunny Sight and Snowy View in progress. *Kurseong.*—A latrine for males below travellers' shed and one urinal constructed, Rs. 193. Water-works extended, Rs. 972.

In the Dacca District.—*Dacca.*—Much land acquired either for widening narrow lanes, for permitting the access of mehters or carts into gors and to other places, for a bullock depôt, and for various other purposes, cost already paid Rs. 1,306; sheds constructed for the domes, mehters, bullocks, latrine, burning ghat, &c., Rs. 7,111; a wall for female ward in Mitford hospital constructed, Rs. 200; two wells sunk, Rs. 44; the Chauk road metalled, Rs. 3,736; a pucca saucer drain in Nawab's main gate, a drain at Armanitolah; a drain at Pannitolah; and one at Santibagan constructed, Rs. 292; levels taken and survey made for improving Baboo Bazar khal for drainage purposes; several earthenware drain connections made departmentally; several night-soil and watering carts built at the workshop; the water-works extended to Hindu Hostel, Rs. 150, to Baboo Bazar mosque Rs. 71, to Cemetery road paid by a private gentleman, to the Railway at cost of Railway Company; the compound of the water-works yards levelled, Rs. 87. *Naraingunge.*—Iron latrines put up, including masonry foundations, Rs. 1,517; two houses erected in the trenching ground, Rs. 69; a branch road to trenching ground constructed, Rs. 77; Suterparah road, Rs 228; and road from Hajigunge to river, Rs. 386, constructed; Ranigunge pipes laid in three roads, Rs. 107; a culvert at Palpara constructed, Rs. 89; a bridge at Shital Lakhya with flooring constructed, Rs. 2,584; compensation paid for land for a burial ground Rs. 225; a house erected in Paikpara burial ground, Rs. 40; the ground of Mahomedan cemetery raised, Rs. 365; bamboo palisades put up in burning ghat, Rs. 118; and compensation paid for land for various purposes, Rs. 2,783. A mehter's shed, metalling of a road, and houses in Khanpoor burial ground in progress.

In the Faridpore District.—*Faridpore.*—A drain, cost Rs 67, and a road, Rs. 19, constructed, and a tank excavated in front of charitable hospital, Rs. 498. *Madaripore.*—A tank excavated in Madaripore village, Rs. 200, and another re-excavated in the west of sub-jail, Rs. 200. *Goalundo.*—The water supply improved, Rs. 397, and a latrine constructed, Rs. 48.

In the Backerganj District.—*Barisal.*—A drain excavated from Kalibari tank to the khal near Wazed's house, cost Rs. 100; stoneware pipes laid in the Sagardi road, Rs. 491, and a shed for cholera and small-pox patients constructed, Rs. 70. *Nalchiti.*—A tank excavated Rs. 125. *Perozepore.*—Tanks excavated, Rs. 103.

In the Mymensing District.—*Nasirabad.*—A shed constructed for isolating cholera patients, Rs. 500, and three plots of land acquired for trenching night-soil and burial of carcasses, Rs 663. *Muktagacha.*—A latrine constructed Rs. 18, a tank excavated, Rs. 476, a masonry well sunk, Rs. 450, and three roads constructed, Rs. 321. *Sherpore.*—A latrine, Rs. 8, and a road, Rs. 100, constructed; and a tank excavated, Rs. 231.

In the Noakhali District.—*Sudharam.*—A kutcha latrine enclosed by mat tattees constructed, cost Rs. 292; and the big tank for drinking purposes cleaned out, Rs. 85.

In the Patna District.—*Patna.*—Two lanes widened, cost Rs. 2,880, and the opening of another lane in progress, Rs. 2,000. This large amount could have been beneficially employed in completing the outfall drain, which is more important than the widening of lanes. *Behar.*—A latrine built at Auhier mohullah, Rs. 75; a well sunk at Kalayanpur, Rs. 69, and another between Paluana and Kalayanpur, Rs. 278; a tank excavated at Mirdad, Rs. 69; and 4 culverts constructed, Rs. 318. The metalling of 3 roads in progress.

In the Gya District.—*Gya.*—A pucca drain at Chanchawra leading to the Khowa ditch constructed, cost Rs. 199; and the erection of a hospital for pilgrims in progress.

In the Shahabad District.—*Sasseram.*—A pucca drain, 3 moveable iron latrines, 4 sheet iron conservancy carts, 3 watering carts, and some pucca roads in course of construction. *Jugdispore.*—A well sunk at Cheratoli, Rs. 74. *Buxar.*—A latrine constructed, Rs 52, and excavation of Douri Shanker tank, and the metalling of Niabazar road in progress. *Doomraon.*—A latrine, Rs. 66, and a culvert, Rs. 374, constructed; and a tank being excavated.

In the Mozufferpore District.—*Mozufferpore.*—Seven roads metalled, the Islampore road widened, and a culvert supplied to it, and a parapet over a bridge on the Worseley road constructed, cost Rs. 2,292. Provision made in the budget for carrying out a drainage scheme. *Hajipur.*—2 Roads metalled, Rs. 607. *Lalgunge.*—Five roads metalled, Rs. 807. *Sitamurhi*—Land acquired and arrangements made for constructing 3 public latrines, and a scheme in hand for providing roadside drains.

In the Durbhanga District.—*Durbhanga.*—Dighi Tank Road metalled, cost Rs. 1,100. A slaughter-house, and the conversion of Boribazar kutcha drain into pucca ones in progress. *Madhubani*—Forty-eight bye-lanes opened out, Rs. 91, and the opening out of 3 others in progress. *Roserah.*—Roads metalled, Rs. 1,011, and 2 roads constructed, Rs. 170

In the Sarun District.—*Chuprah.*—Seven carts (2 conservancy, 1 depot, 1 latrine, 2 watering) and 1 urinal constructed, cost Rs. 333; two D'Abreu's latrines purchased, Rs. 201; one latrine constructed, Rs. 223; 4 iron urinals put up, Rs. 164; and three roads widened, Rs 257 *Sewan.*—Two roads metalled and one of them supplied with drains, Rs 563; and the construction of side drains to the station road in progress.

In the Chumparun District.—*Bettiah.*—A public latrine, cost Rs. 59, and the construction of spill drains to wells in progress. *Motihari.*—One pucca road, 10 kutcha roads

and 10 bridges constructed, Rs. 2,724; 6 roads metalled; side drains to 3 roads provided, Rs. 810; a large tank near the cutchery excavated, two latrines constructed near serai, and a Municipal market opened out.

In the Monghyr District.—*Monghyr.*—Reservoirs constructed near Municipal wells, cost Rs. 64; 5 culverts put up to improve waterways in different parts of the town, Rs. 274; and Puranigungo road metalled, Rs. 613. *Jamalpore.*—Four sweeping carts provided, Rs. 220; a pucca well sunk, Rs. 148; and 2 pucca latrines with corrugated iron roofs in course of construction.

In the Bhagulpore District.—*Bhagulpore.*—Six roads metalled, Rs. 2,663; the Soojagunge drainage scheme completed, and the water-works commenced. Metalling of a road and cutting a nullah in progress. *Colgong.*—A cutcha thatched latrine for males and females constructed, Rs. 55.

In the Purneah District.—*Purneah.*—Two latrines constructed near the Civil and Criminal Courts; the Lalbag and Line bazar drainage improved, cost Rs. 278 The former is yet in progress. A canal excavated through the civil station.

In the Maldah District.—*English Bazar.*—A pucca drain in Kallitollah 1st lane, Rs. 389; a toll tree bridge in the South Strand Road, Rs. 400; a large conservancy cart, Rs. 37; and 31 temporary latrines, Rs. 93, constructed. *Old Maldah.*—Drainage works undertaken in 3rd section Sarban road, Rs. 258; and the same road metalled, Rs. 124.

In the Sonthal Pergunnahs District.—*Deoghur.*—A large tank excavated, Rs. 267, and sinking of a well in progress. *Sahebgunge.*—Five pucca drains constructed, Rs. 673.

In the Cuttack District.—*Cuttack.*—Stone flooring to Dolundha slaughter-house provided, cost Rs. 262; Samia Talow drainage, Rs. 512; Thoria Sahi drain branch No. 1, with masonry bridges, Rs. 614, and a masonry bridge on Puri roadside main drain, Rs. 50, constructed; 7 urinals put up near kutcherries and main bazar, Rs. 23; night-soil depot at Gossain Bagichha constructed, Rs 44; house in Municipal market, Rs. 439; three kutcha roads, Rs 362, and one pucca road, Rs. 121, constructed; 3 roads widened, Rs. 705. *Kendrapara.*—Two roads metalled, Rs. 465, and the metalling of another in progress. *Jajpur.*—A road metalled and a drain excavated.

In the Puri District.—*Puri.*—One urinal put up near the Magistrate's kutcherry, cost Rs. 60, and the construction of two latrines for females, 4 urinals, a pucca drain near Dolebedi, and an experimental well in progress.

In the Balasore District.—*Balasore.*—The construction of a slaughter-house in progress.

In the Hazaribagh District.—*Hazaribagh.*—A well sunk in the slaughter-house compound, cost Rs. 145, and the main nullah improved, Rs. 589. *Chatra.*—One road and three culverts constructed, Rs. 515, and the construction of a Municipal market and of a road in progress.

In the Lohardugga District.—*Ranchi.*—A public latrine erected and some conservancy carts purchased; drains excavated, cost Rs. 50, and roads metalled, Rs 2,731.

In the Singbhum District.—*Chyebassa.*—Trees planted on roadside, cost Rs. 54.

In the Manbhum District.—*Purulia.*—Stone pitched drains, cost Rs. 529, and a range of pucca buildings in the Municipal market, Rs. 1,817, constructed.

IN DISTRICTS.

Burdwan.—Rs. 12,377 were expended on road works and bridges As relief works in tracts in the district where distress on account of scarcity was felt, roads were constructed at a cost of Rs. 718 and village roads improved for Rs. 9,065. Government also granted Rs. 5,000 for the improvement of the water-supply in the distressed tracts, and Rs. 20,000 for roads. Of the former amount Rs. 2,479 were expended, and of the latter Rs. 4,223. In addition, Rs. 30,000 were advanced under the Land Improvement Act to landholders and superior tenants for cleaning and deepening old and silted up tanks and excavating new ones.

Bankura.—Forty-three village roads were provided in different parts of the district, which have, it is stated, vastly improved the sanitation of the villages in which they were constructed by draining off stagnant pools of water, filling up hollows, and removing noxious vegetation.

Birbhum.—The Subdivisional Officer of Ramporehaut had, by employing the Railway engine and pipe, several tanks in his head-quarters filled with water from a small stream which had been bunded up by the Railway Engineer for conveying water to the Railway tanks. Of the cost incurred (Rs. 526) Rs. 400 were given by Government and the balance was raised by subscription. But for this timely supply the people would have suffered severely. Seventeen tanks were excavated at a cost of Rs. 8,689 as relief works during the scarcity. These tanks will supply drinking water to, and, by being used for irrigating the paddy fields, afford food for the people.

Midnapore.—Three tanks and two wells were excavated, two bunds repaired, a drainage channel provided, a gap filled up, &c., in the Government khas mehals at a cost of Rs. 20,283. Village roads were constructed, or were in course of construction in several localities in the Sudder, Contai, Tumlook and Ghatal subdivisions. The total cost amounts to Rs. 6,268. The road or bund connecting the terminus of the Midnapur High Level Canal with the Cuttack Trunk road was widened and metalled at a cost of Rs. 8,803, and a district road

from Pingbani to Sabong was constructed at an expenditure of Rs. 1,840. Fourteen tanks were excavated, and nine reclaimed by private individuals at a cost of Rs. 5,108.

Hughli.—Two tanks were excavated by Baboo Joy Krisna Mukerji of Utarpara near the Nalikul and Tarkessur Railway station at a cost of Rs. 500. Two tanks were re-excavated, one by Durga Dass Chuckrabutty near Champdany, cost Rs. 200, and the other by Kalu Mundul near Ramnagore, cost Rs. 300.

Howrah.—Several roads and bridges were constructed in the Uluberia town and thana at a total cost of Rs 6,526. It should be mentioned that this amount includes cost of repairs, which has not been furnished separately.

24-*Pergunnahs.*—A culvert was constructed on the Culpee road, cost Rs 150, and a portion of the road from Nimta to Gouriapur was metalled, cost Rs. 1,000, contributed by the North Dum-Dum Municipality. A widow named Jaga Bewah excavated a tank at Lackhi Kantapur in Diamond Harbour sub-division, cost Rs 300 or 400, for the supply of drinking water, and Moharajah Kamul Krishna Bahadoor contributed Rs. 400 for the clearance of the Khurdah Khal.

Nuddea.—The masonry superstructure of the Kanyedanga bridge on the Meherpore and Kanyedanga road was completed, and the necessary iron work and timbers required for it was collected, cost Rs. 290, but the bridge could not be completed. Village roads in the Sudder, Ranaghat, Chuadanga, Meherpur, and Kushtia subdivisions were constructed, or the existing communications restored, cost Rs. 6,730. These works improved the sanitary status of the villages in many ways. In the construction of the roads many bad holes and low level areas in which water used to lodge were filled up, jungle was cleared, and in many cases passages for discharge of village drainage were opened. In the Sudder sub-division most of the works formed famine relief works. Heavy earthwork was executed for relief purposes on the three unfinished famine roads (commenced in 1874) of Chapra to Tehatta, from Kaligunge to Meera, and from Bikrampore to Golipara, cos tRs. 3,175. Twenty-two tanks were re-excavated in the Ranaghat subdivision, which tended to improve materially the supply of water, both for drinking and culinary purposes. The silted up mouth of the Choorny at the point where it had originally discharged itself into the Ganges was opened. A number of tanks were excavated by private individuals, particulars not furnished.

Jessore.—A tank was excavated by Sristi Dhur Mundul at village Harishpur in the Bongong sub-division at a cost of Rs. 700.

Khulna.—Some tanks were dug by private individuals, which no doubt benefited sanitation, but particulars regarding them have not been furnished

Dinagepur.—The drainage canal was maintained by the Road Cess Department at a cost of Rs. 699, and several bridges with sufficient waterway were built in the south on the road between Mohadebpore and Sultanpore station of the Northern Bengal State Railway.

Rajshahye—A road in the Manda police station, cost Rs. 400, a road from Nattore to Amhatee, cost Rs. 700, and a road from Panchbibi to Sahebgunge, were constructed. Drains to the last-named road have not yet been supplied. The zemindar of Poothia opened the mouth of the silted up river at Nundragachi to allow of the Pudda water being let into it. By this means the country was flushed with fresh water, the public health and agricultural prospects being benefited thereby. The following tanks were excavated by private individuals. One at Nattore cost Rs 1,500, 1 at Bhootma cost Rs. 1,100, 3 at Bandaikhara cost Rs. 792 and Rs. 600 respectively, 2 at Lalpore cost Rs. 875 and Rs. 600 respectively, 2 at Charghat cost including 10 old ones re-excavated Rs 4,275, and 8 at Bagmara cost Rs. 4,000. Two hundred and seventy-three pucca wells and 557 kutcha ones were sunk in the district, bringing up the total wells in the district to about 6,812. These wells, the Magistrate says, were chiefly made in the Barind country, where the soil is suitable, from fear of want of drinking water in the hot months, as the tanks had all but dried up owing to the scanty rainfall of the past few years.

Bogra—In 7 villages in the Jaipur Government Estates situated in thana Panchbibi, 7 wells, provided with parapets, were sunk, and village roads constructed, which, considering that this part of the country is covered with thick jungle, will prove beneficial in a sanitary point of view. The remaining portion 5½ miles of the Dupchanchia road was completed, cost Rs. 2,000. Thirty-five bamboo culverts were constructed on 5 roads in different parts of the district; and 2 tal wood bridges were constructed on the Sultangunge-Adamdighi and Khetlal-Surhatty roads.

Pubna.—The tract from Hondyal to Tarash about 8 miles was raised. Many other tracts were also raised, but not sufficiently to stop drainage and to be above flood level. A road about 2 miles in length in village Potajea, and another about ½ long in village Tarash were constructed. Four tanks were dug by private individuals at different places at a cost of Rs. 5,300, and wells are to be sunk in the Government Estates in Tarash.

Darjiling.—Scavenging establishment was provided for 11 bazars in the district at a cost of Rs. 564. Miscellaneous improvements were effected in the large bazar in the Terai, cost Rs. 395. The drainage of Siliguri was improved, cost Rs. 151. Improvements were effected to the water-supply of Kalimpong, cost Rs. 167, a new burial ground was established at Kalimpong. Trees were planted in Siliguri in the Terai in the neighbourhood of Darjiling and Kalimpong, cost Rs. 427.

Julpaiguri.—The Chalsa road was constructed by private subscription and a grant from the Estates Improvement Fund.

Faridpore.—Several village roads were constructed, and 11 tanks were excavated in several parts of the district by the Road Cess Department, cost Rs. 3,650. Eleven tanks were also dug by private persons at a total expenditure of Rs. 3,196.

Backergunge—About 81 roads were constructed at a cost of Rs. 38,711, and a tank, cost Rs. 100, and eight khals, Rs. 1,486, were excavated.

Mymensing.—A tank was excavated at the Bhagalpore village in thannah Bazitpore, cost Rs. 200, and two in the Government Kashmahal, Tuppah Nickli, cost Rs. 686 and 270 respectively, and an old tank in the same village was re-excavated, cost Rs. 131, and a few roads were constructed.

Noakhali.—Sixty-one iron and other bridges were in course of construction in different parts of the district, estimated to cost Rs. 7,493.

Tipperah.—A khal from Chur Ranpore in thannah Chandpore was excavated at a cost of Rs. 266; a tank was dug by the ward's estate of Ashutoshnath Roy, a zemindar of Serail in Brahmenberiah, cost Rs. 435. Opening out of silted up watercourses in pergunnah Gangamandal and Patikara north of Comillah in progress. The following works were executed by private individuals. A khal extending to two and a half miles from Ramchandrapore to Daikata river in thana Laksham, cost Rs. 520, exclusive of works of a similar nature estimated to cost Rs. 10,000 now in progress. Four tanks in thana Laksham and five in thana Hazigunge, cost Rs. 3,745.

Patna.—Sixteen culverts and four bridges, cost Rs. 2,200, and one road from Rajgir to Banganga, Rs. 275, were constructed in the subdivision of Behar, and another road was in course of construction.

Gya.—A number of roads was constructed, details of which have not been furnished.

Shahabad.—Various improvements had been and were being effected (for details see paragraph—of the Report) in the Government Estates in the Sasseram subdivision, and in the town of Nassriganj belonging to Government, cost already incurred Rs. 1,414.

Durbhanga.—Some roads were metalled, and several small tanks were excavated in different parts of the district by private individuals, but these tanks are considered to be of very little use, as in the course of a few years they are sure to become repositories of stagnant and foul water.

Sarun.—Several district roads were metalled and bridged, and the unmetalled main and village roads were improved. Seven pucca wells were sunk in different parts of the district from loans advanced under Act XIX of 1883. The railway authorities opened now culverts or barrel drains through the B. and N. W. Railway embankment running through the district.

Chumparun—Three roads were constructed and some tanks excavated, and a great many wells sunk by private individuals as outlets for private charity.

Monghyr.—Seven roads were constructed, one old tank was excavated by the owner, cost Rs. 419, and six tanks were excavated by private individuals, cost Rs. 2 350.

Bhagulpore.—In the Sudder subdivision sections I and II of Ghôgha-Assi road were bridged, the embankment of the former was raised, and the latter was otherwise improved, cost Rs. 10,284. The waterways were taken in hand, cost Rs. 6,563. In the Banka subdivision a bridge was restored in the road from Bhagulpore to Sonthal Pergunnahs, Rs. 3,718. In the Mudhepurah subdivision a bridge on the Mudhepurah-Sonbursa road was restored, and waterway provided, Rs. 2,496. In the Supol subdivision a semi-permanent bridge on the 72nd mile road was restored and some wooden bridges were constructed. In Mudhepurah a ryot named Gunga Kumar excavated a tank at a cost of Rs. 400 for drinking water for the people and cattle.

Purneah.—Thirty small culverts by Ranigunge pipes have been supplied at Kishengunge, and the Khagra Raja has metalled the road constructed by him leading from his house to the Ganges and Darjiling road. This Raja has sunk three wells for the use of the people who resort to the Weeke's mela, which is held a mile from the boundaries of Kissengunge and Khagra towns. A bridge across the Ganges and Darjiling road was constructed.

Maldah.—Roads were metalled, cost Rs. 360; kutcha drains constructed, cost Rs. 316; and bridges erected, Rs. 925. Roads from Bamangola to Nityanundpore, 18 miles, cost Rs. 4,809, and from Gumashtapore to Nachole, 12 miles, cost Rs. 3,233, were constructed; eight tanks were excavated in villages in different parts of the district by private individuals, cost Rs. 3,330.

Cuttack.—The opening of the canal from Jajpore to Akhuapada was commenced, but the work was stopped owing to financial pressure.

Puri—A large number of wells, tanks, some causeways, and two bunds were constructed in different parts of the district. These works were executed by Government from the provincial and imperial revenues, and are calculated to improve the sanitation of the places in which they are situated. Two tanks were excavated by private individuals, and three wells sunk by the Magistrate from the Jaganath Road Fund on the Jugurnath road for supplying good water to pilgrims especially. Two sheds were erected in Gope station by some zemindars for the use of travellers. The excavation of some tanks was in progress at the close of the year in the famine-stricken tracts of Parikud, Molud and Bagrakat with a view to provide work for the distressed people in those parts. These tanks when completed will improve the sanitary condition of the neighbouring villages, which, owing to their situation on the Chilka lake, become unhealthy owing to deficiency of water in certain seasons of the year.

Hazaribagh—Some district and village roads were constructed.

Manbhoom.—The main bundh in Katras, and other less important reservoirs were completed. The Katras bund is a fine sheet of water, but it is to be regretted that in its basin a number of trees has been left. Five wells were being sunk in the camping ground at Govindpore, Rajgunge, and Topchanchi. These are of course intended primarily for the use of troops, but they will also be very useful adjuncts to the existing water-supply of the localities.

APPENDIX No. IV.

ABSTRACTS OF INSPECTION REPORTS ON TOWNS VISITED IN 1885.

Abstracts of Inspection Reports on Towns visited in 1885.

Balasore Town.—*Inspected in January* 1885.—The sanitary arrangements of this town were not satisfactory. There were many grave sanitary defects specially under the head of water-supply. The town was full of pits, hollows, and irregular surfaces, which contained stagnant water and tended to keep the houses round about them damp, and so proved injurious to health. Want of funds did not permit the Commissioners to execute during the past year any original sanitary works.

The suggestions were—(1) To devote annually a considerable portion of the saving effected by the municipality having been relieved of the Police charges, to improve the sanitation of the town. (2) To bring into operation Parts VI and IX of the Municipal Act, as the Commissioners ought to possess specific powers to prevent the irregular construction of houses, privies, and drains, and to keep privies clean. (3) To endeavour to get the numerous pits, hollows, and irregular surfaces filled up. (4) To prohibit the making of excavations for taking earth for building purposes, &c. (5) To put up lights, in the first instance at places where their want is most badly felt. (6) To plant trees on the sides of the principal roads as they serve many useful purposes. (7) To attend to the levels of the kutcha drains as they are defective at places. (8) To provide more pucca roadside drains as funds permit. (9) To raise pucca platforms around the public wells so that soakage of water in their vicinity may be prevented. (10) To provide all the wells with metal buckets and chains for drawing water. (11) To plant no new trees on the banks of tanks, and to remove some of those already existing. (12) To pay a good deal of attention to tanks generally, as the severe outbreaks of cholera common in the town indicate an impure water supply. (13) To put a stop to the practice of defæcating on the banks of the Buribalung river and the Nunijuri khal, from which drinking water is taken. (14) To have the lanes and bye-paths daily swept and cleaned. (15) To construct more public latrines at such places as the kutcherries, markets, serias, &c., which are much frequented by the people. (16) To have the trenches for burying night-soil dug in long lines, shallower and closer together, and one foot wide by one foot deep. Also, after one part of the ground is well manured, to get it cultivated. (17) To open more trenching grounds as the present one is not conveniently situated with reference to the different night-soil depots. (18) To prevent the incomplete disposal of night-soil from private privies by private mehters, and to bring to justice the offenders in all such cases. (19) To have the gumlahs and drains of the public latrines tarred twice a month, also to treat similarly the walls of the corrugated iron latrines for about two feet from the ground to keep the iron from corroding. (20) To introduce in the town Part IX of the Municipal Act as soon as possible. (21) To prevent promiscuous defæcation as much as possible, and thereby make an advance towards cleanliness of the town. (22) To attend early to the subject of closing the Ossanund burial-ground which is crowded. (23) To see that bodies are buried in lines to save space, and to allow the ground to be used in regular and systematic order. (24) To bury Mahomedan and Christian pauper dead. (25) To plant the old burial ground with trees as the roots of living plants shorten the period of decay, absorb the products of decomposition, and thus prevent the escape of deleterious gases (26) To appoint persons to supervise the process of cremation at the burning ghâts. (27) To get the clothes and pillows of the dead burnt invariably with the body to prevent the Domes taking them to the bazar for sale and thus helping the spread of contagious diseases. (28) To require the owners of the Mundle and Chandni markets to rectify the defects in connection with those places. (29) To provide the Naya bazar, which is frequented by pilgrims on their way to Juggernath, with a good well or tank : if the former, to have it well protected and supplied with buckets and chain. (30) To lose no time in providing the town with a slaughter-house. (31) To get all the bones removed from the vicinity of the butchers' shops by the municipal mehters, and to make every endeavour to maintain cleanliness. (32) To bring the provisions of the law to bear upon such persons who get themselves inoculated if they return to town with the vesicles on them. (33) To perform vaccination in four points on the upper arm in all children over four months old, and to transmit the lymph from arm to arm

Action taken on the suggestions—(1) Steps have been taken to introduce Parts VI and IX of the Municipal Act into the town. (2) The planting of trees on the roadsides is being most actively carried on. (3) The owners of trees on the sides of tanks have been required to cut down all overhanging branches. (4) The drains have been well attended to, and are being gradually improved. (5) The owners of the Chandni and Mundle bazars have been ordered to rectify the defects in those places. (6) Steps have been taken to prevent the incomplete disposal of night-soil from private privies. (7) Regarding the suggestions to have the numerous pits, hollows, and irregular surfaces filled, and to re-excavate one or two tanks, it is stated that the municipality is too poor to give effect to them.

Cuttack Town.—*Inspected in January* 1885.—The sanitation of this town was not quite satisfactory. The drainage arrangements were defective, and those for the supply of water for drinking purposes were no good. Since the town was last inspected in 1879,

much had been done to mend matters in these directions and to improve generally its sanitary status. On the date of my visit, there were evidences to show that its sanitary welfare was being cared for by the Commissioners.

The suggestions were—(1) To take steps to obviate the recurrence of the diminution of the income which is a very serious matter. (2) To utilize the sections of Part VI of the Municipal Act III (B.C.) of 1884 which relate to building regulations, and to prevent the crowding together of huts in the *bustis* without proper provision for ventilation or passages between them. (3) To look after the filthy condition of the surroundings of houses complained of, as it tends to vitiate the atmosphere. (4) To largely use street sweepings and the refuse from private houses in filling up the foul pits, hollows, and excavations which abound within the limits of the municipality, and which form so many centres of cholera and other diseases. (5) To improve the condition of the side drains that are for the most part kutcha and liable to be silted up, and to attend early to the subject of providing good pucca side drains to streets. (6) To try to remedy the unsatisfactory state of the drains in private houses. (7) To insist on the strict observance of sections 202 and 204 of the Municipal Act, and to get all obstructions or encroachments in or on any road or open drain removed at the cost of the offender. (8) To take precaution to prevent soakage around and in the vicinity of the municipal and other wells. (9) Not to allow the construction of any privies, urinals, &c., within 50 feet of any public tank or water-course. (10) To prevent the throwing of corpses or carcasses into the river, and to bring the offenders to justice. (11) To consider the feasibility of undertaking a water scheme by raising a loan and seeking assistance from Government and subscriptions from wealthy residents. (12) To have all the streets as well as the lanes and bye-paths swept daily. (13) To discourage the practice of throwing rubbish on plots of ground behind houses. (14) To provide more public latrines as the present number is insufficient for the requirements of the town, and to construct them near kutcherries, markets, serais, fairs, and other places much resorted to by the lower orders of the people. (15) To adopt measures to increase the number of pucca latrines. (16) To have the gumlahs, drains, and the walls of public latrines tarred at least twice a month. (17) To increase the number of public urinals and to erect them at convenient parts of the town. (18) To prevent as much as possible the practice of promiscuous defæcation. (19) To put down at once the practice of throwing night-soil here and there by some of the private mehters. (20) To suppress the few well-privies there are in private houses. (21) To open more trenching grounds for the convenience of the various night-soil depôts, and to have the trenching grounds regularly cultivated. (22) Considering the filthiness of private privies, to bring into operation Part IX of the Municipal Act, and, pending its introduction, to properly look after the private privies in the town in view to their being kept clean. (23) To encourage as far as possible the practice of using phenyle for disinfecting public latrines and urinals. (24) To provide such localities as Mohendipur, Juggernathbullab, Daluram Misser's Lane, Uriya Bazar, &c., with proper drainage and roads, and with ample latrine accommodation, and to see that the houses in these localities are so constructed as to permit free ventilation. (25) To have the slaughter-houses sufficiently flushed with water and the cess-pools properly cleared out daily. (26) To keep the slaughter-houses scrupulously clean so that no offensive smell at any time be perceptible in them. (27) To have the Keserpore slaughter-house enclosed with a wall. (28) To close, under the provisions of the law prescribed for the purpose, the Kuddum Russel burial-ground, which is situated in the heart of the town, and is very crowded. (29) To see that the graves in the Mahomedan burial-ground are dug in rows and at least 6 feet deep. (30) To plant all the burial-grounds with trees as the roots of living plants shorten the period of decay, absorb the products of decomposition, and thus arrest the escape of noxious emanations. (31) To see that all the clothes and pillows of the dead are burnt with the body, and not to allow the washermen to take them away and sell them in the bazar, as this practice is likely to cause contagious diseases to spread. (32) To utilize fully the provisions of the Compulsory Registration Act, and to adopt measures generally for improving registration.

Action taken on the suggestions.—(1) More public latrines are being provided. (2) The people are being induced to improve the drainage arrangements inside their houses and engage municipal mehters for cleaning their cess-pits. (3) Steps have been taken to increase the number of conservancy carts. (4) Urinals are being put up near the kutcherry, the principal bazars, and other parts of the town.

Puri Town.—*Inspected in January and February* 1885.—Although the financial position of the municipality had improved very considerably since it was last inspected in 1880, its sanitary arrangements were not such as could have been desired. There were many sanitary defects, particularly the arrangements under the heads of drainage and water-supply were not satisfactory, and, in some instances, objectionable. Much had been done to improve the sanitation of the town, but much more remained to be done. It appeared that the Commissioners were taking much interest in the sanitary welfare of the town.

The suggestions were—(1) To increase the length of mileage lighted as funds will permit. (2) To utilize the sections of Part VI of the Municipal Act, which relate to building regulations, as the improper laying out and construction of buildings lead to great evils. (3) To carefully look after the conservancy of the narrow lanes so that they may not become receptacles for all sorts of filth and offensive matter of the neighbourhood. (4) To supply the roads with side drains and with sufficient waterway. (5) To carry out to completion as soon as practicable the drainage scheme which has been taken in hand. (6) To connect the house drains

with the side drains of the streets so as to discharge into them, and to get the offensive cess-pits built into the plinths of pucca houses filled up with blocks of laterite. (7) To construct feeder drains to the main drainage system which is now in course of construction, so that complete and rapid drainage may be effected. (8) To have the outlet intended to carry off the stagnant water of the Markanda tank, which is choked at its further end, cleaned, so that as fresh water runs in the foul water may run out. (9) To put another ring of laterite stone round the mouths of the wells so that in bathing water may not splash back into them. (10) To analyse the water of some of the wells in the crowded quarters that are in a foul state, and to close them if the water is found to be bad. (11) To use invariably buckets and chains in raising water from the wells. (12) To provide some more wells near the pilgrim tanks as at times the gathering is enormous, and to warn people against drinking foul tank water and to encourage them to use that of the wells. (13) To consider the feasibility of, and with that view to take professional advice with regard to a scheme for the proper supply of drinking water for the town. (14) Not to allow owners of houses to accumulate rubbish behind their houses, but to compel them to place it at appointed places for removal. (15) To provide more public latrines as the present number is inadequate for the requirements of the town. (16) To provide trench latrines surrounded with mat enclosures for the pilgrims near their morning bathing place, so that defæcation all about the town, and specially near the margins of tanks, may be prevented Also to compel the pilgrims to resort to them whenever they are present in numbers in the town. (17) To take steps to prevent promiscuous defæcation, and to induce the people to use the public latrines. (18) In constructing public latrines to have the accommodation for females entirely separate from that for males, in different enclosures with different entrances. (19) In addition to the gumlah for fœces, to provide another gumlah in each cell of the latrines for urine and washings, and to have the gumlahs, the drains, and the walls of the latrines up to three feet high tarred at least twice a month. (19) To carefully carry out the dry earth system in the public latrines (20) To introduce Part IX of the Municipal Act for the better control of the private privies. (21) To consider the subject of constructing a proper municipal market on an approved plan. (22) To have the Mahomedan burial-ground enclosed by a wall. (23) To exercise proper and legitimate supervision over the sale of the Mahaprasad or holy food, as its consumption, if bad must be very injurious to the health of the pilgrims. (24) To consider carefully the question of the uses to which the Puri Lodging-house Fund might be put. (25) Not to employ the municipal vaccinators outside the limits of the municipality. (26) To prosecute under the prohibitory law such persons as get inoculated and return to town with the vesicles on them. (27) To introduce into Puri the *hath-chitti* (hand-book) system which is in force in other districts, for registering births and deaths. (28) To fully utilize the provisions of the Compulsory Registration Act. (29) To specially appoint a person to detect and report evasions of the provisions of the law by the people, and to punish the constables under section 6 of the enactment whenever they omit to report the births and deaths occurring in their beats. (30) To induce the midwives to report all births at which they attend.

Action taken on the suggestions.—(1) Twenty-five new lights have been put up at different places. (2) The roads are being gradually provided with side drains. (3) The offensive cess-pits built into the plinths of pucca houses are being dealt with (4) Arrangements have been made for the excavation of an experimental well by the District Road Committee of Puri. (5) The overseer has been instructed to inspect as often as possible the lodging-houses and other dwelling places, and cause the rubbish collected therein, or on lands attached thereto, to be removed without delay. (6) Four public urinals and two public privies are being constructed. (7) Temporary privies and urinals with mat enclosures will in future be provided for the pilgrims at the time of the festivals. (8) The gumlahs, &c., of the public latrines will be regularly tarred, and a cask of coal-tar has been purchased for the purpose. (9) The dry-earth system has been introduced in the public latrines. (10) Steps have been taken to introduce Part IX of the Municipal Act. (11) The Commissioners, who are monthly deputed to inspect the temple, have been requested to examine and superintend the sale of the Mahaprasad or holy food. (12) Steps have been taken to detect and prosecute those who get themselves inoculated outside the town, and return to it with the vesicles on them.

Krishnaghur Town.—*Inspected in February* 1885.—Krishnaghur appeared to be a neglected place, which, though the seat of a college and inhabited by educated people, had made no advance in sanitation, but where, on the contrary, grave sanitary defects existed, particularly in connection with its conservancy, drainage, and water-supply. What little improvement had been effected appeared to have been brought about through the exertions of Major Ramsay and of Dr. Murray. The Commissioners were not evincing that interest in the sanitary welfare of the town, which could have been expected of them.

The suggestions were—(1) To employ the whole of the amount become available by the municipality having been relieved of the Police charges, and, in addition, to devote annually a legitimate share of the remaining income, for placing the town on a sound sanitary footing. (2) To pay greater attention to the subject of filling up pits and hollows, and to utilise for the purpose in the cold season the sand from the dry bed of the river (3) To consider the advisability of raising a loan to meet the cost of providing proper drainage for the town. (4) To adopt means for increasing considerably the water-supply of the town. (5) To have the new tank in Ward No. properly constructed and cared for, as it would

afford a supply of drinking water to the neighbourhood where it is much required. (6) To provide all the public wells with buckets and chains, and to prevent the indiscriminate use of private vessels for the drawing of water. (7) To have the whole town thoroughly swept, and the sweepings and rubbish utilised by filling up the numerous pits, hollows, &c., about the town (8) To consider the question of the pay and horse allowance of the conservancy overseer and of the insufficiency of the conservancy establishment. (9) To get all lands, used for the purpose of being manured by Major Ramsay's treble-seated movable latrines, cultivated to ensure purity of soil. (10) To see why the pucca public latrine beside a municipal shed at the corner of the Rajbarry moat was not in use. (11) To provide more public latrines so that promiscuous defæcation may be obviated. (12) To make every endeavour to suppress the well-privies (13) To introduce Part IX of the Municipal Act to control the arrangements connected with private privies. (14) To have all the night-soil trenched and to have the trenches dug one foot deep instead of 18 inches. (15) To consider the subject of establishing a municipal market as soon as funds are available for the purpose. (16) To take steps for the early extension to the town of the different sanitary sections of the new Municipal Act, and to have them not only introduced, but stringently enforced

Action taken on the suggestions.—(1) The obstructions to the pucca drains are being gradually removed. (2) The municipal tank in Ward No. 3 has been excavated. (3) River water was introduced into almost all the important tanks (4) Three new wells have been sunk in Wards Nos 3, 4, and 5 respectively. (5) All the public wells will be supplied with buckets and chains for drawing water. (6) The water-supply will be considerably increased next year (*i.e.* 1886), when some old tanks are expected to be dug out by private individuals, Moharani Surnamoyee, Babu Nuffer Chandra Pal Chowdhery, and the Manager of the Nuddea Maharajah's estate each having promised to excavate one tank, and the owners of some tanks in Ward No. 4 having also made similar promises. (7) The conservancy establishment has been largely increased, and a sub-overseer has been appointed to help the overseer in properly discharging his duties. (8) Steps have been taken to carry out the trenching system properly. (9) All the well privies will be suppressed very soon.

Jessore Town.—*Inspected in February* 1885.—The sanitation of this town was not satisfactory. There were grave sanitary defects in existence, particularly under the heads of conservancy and water supply which demanded early attention. Since the municipality was last inspected in November 1881, very little had been done to improve its sanitary status. The Commissioners were not displaying that interest in ameliorating the condition of the town, which might have been expected from them.

The suggestions were.—(1) To allot annually an adequate share of the income to improve the sanitary status of the town. (2) To move Government to extend the provisions of those parts of the Municipal Act which have not yet been brought into operation in Jessore. (3) Not to permit in future the construction of such sunshades and shop-platforms as are thrown out beyond their proper aligument and form great encroachments on the width of the streets. Also to endeavour to have the existing ones removed. (4) Not to permit any new excavations for brick-making within municipal limits. (5) To have the small swamp at the back of the District Superintendent's house filled up with sweepings and earth. (6) To have the jungles near the houses and specially near the Chandna Rajbarry uprooted, and the house enclosures kept permanently clear of it. (7) To attend to those pucca bazar drains that are in very bad repair. (8) To present the shop-keepers from placing planks or boxes on, or erecting platforms over, the drains, and to have the existing encroachments removed at the cost of the owners. (9) To induce the people to remedy the very defective condition of the house drains. (10) To have all the tanks that are set apart for drinking purposes cleaned out, specially the Laldighi which has not been touched for the last ten years. To have all these tanks re-dug and to adopt measures for preventing the entry of surface drainage into them, and, as far as possible, to have the trees on their banks removed. (11) To consider the advisability of having the small private tanks which are far too numerous, and are also in very bad condition, filled up. (12) To have the new tank at Sankerpore set aside for drinking only, and to acquire the Gohatta tank, which is private property, and get it reserved for the same purpose. (13) To prevent defæcation on the banks of the river Bhoirub, and the throwing of corpses into it, and to deal with the offenders according to the provisions of the law. (14) To increase the conservancy establishment and the number of carts, and to appoint an overseer to supervise the work properly. Also to see that the overseer defines the work of each man and takes that work from him. (15) To have the streets and lanes swept daily and surface cleansing generally and closely attended to. (16) Not to permit the accumulation of rubbish about houses in the bazar, and to compel the owners under the law to put it out on the streets or other appointed places for removal by the municipal carts. (17) To provide year by year additional latrines, and to construct one as soon as possible at Purana kusba. Also to have the buildings for females entirely separate from those for males in different enclosures and different entrances. (18) To have the dry-earth system persevered with in public latrines. (19) To have the gumlahs as well as the drains and the walls of the public privies to the height of about two feet from the floor, tarred at least twice a month. (20) To endeavour to put down promiscuous defæcation. (21) To carry out the trenching system properly, the trenches being shallower than at present, not more than one foot deep and one foot wide, and dug in straight lines. Also to have the second trenching ground regularly cultivated. (22) To have the trenching grounds properly fenced and thereby protected from the inroads of the pigs which frequent them. (23) To consider the advisability of removing the pigs outside municipal

limits. (24) In the Birandi burial ground to have the bodies buried in lines to obviate waste of space. (25) To have the graves dug sufficiently deep to prevent jackals unearthing the bodies. (26) To attend carefully to the conservancy of the bazar, and to appoint a special sweeper to look after its cleanliness. (27) To compel the owner of the slaughter-house to correct as soon as possible the defects that were pointed out. Also to provide the place with a cemented drain with proper levels so that blood and washings may easily run into a cemented trough, whence it could be removed daily by the conservancy carts. (28) To consider the advisability of establishing a municipal market and a slaughter house. (29) To fully utilise the provisions of the Compulsory Registration Act which is in force in the Jessore town.

Action taken on the suggestions.—Some of the suggestions have been adopted and certain others are considered very good, and will be carried out as far as the funds permit. Regarding the observations anent registration of births and deaths, an extract from the report will be sent to the District Superintendent of Police.

Khulna Town.—*Inspected in February* 1885.—This town is composed of a narrow strip of land on the west bank of the Bhoirub river, with the new railway premises towards its northern and the civil station to its southern extremity. Formerly Khulna was a petty station, but about three years ago it was converted into the head-quarters of the Khulna subdivision, and towards the close of the last year it was constituted a municipality, and the Municipal Act III (B.C.) of 1884 extended to it; but the municipality had not got into proper working order, and its income was very small, so that the various sanitary provisions of the Act could not be utilised in their entirety. There were many grave sanitary defects in existence. The drainage and conservancy arrangements were altogether unsatisfactory, and those regarding the disposal of the dead were in many instances very objectionable. A scheme for the drainage and laying out of the town was under consideration, and would no doubt receive the serious attention of the Commissioners.

The suggestions were—(1). To attend, in the first instance, to the proper laying out of the town, as on this will greatly depend its health and consequent prosperity. (2) Not to lose sight of the necessity for extending to the town the omitted parts of the Municipal Act, and, as soon as the municipality is in a position to do so, to utilise the sanitary regulations, particularly those contained in Part IX relating to latrine arrangements. (3) To attend first of all to the subject of improving its financial position, so that a sufficient income may be realised and a fair share of it be available year after year for placing the town on a sound sanitary footing. (4) When new roads well laid out with proper side drains are constructed, not to allow them to be encroached upon. (5) To construct a good metalled road along the river bank both for the comfort of the people and for the proper commercial development of Khulna. (6) To gradually fill up all pits and excavations, and not to permit any new excavations for the purpose of taking earth for house plinths. (7) To allow householders to remove the earth that will become available in digging tanks for water-supply for use in raising plinths. (8) To prevent the construction of new huts without any regularity and quite irrespective of ventilation, facilities for scavenging, &c., and to fully utilise, when brought into operation, the sections of Part VI of the Municipal Act which relate to building regulations. (9) To make provision in the scheme for the improvement of the drainage of the town to connect house drains with the city drains as their present condition is very bad. (10) To excavate a new tank for the supply of good drinking water in the brickfield near the new kutcherries, and to acquire one of the best tanks in every village and to have it enlarged and reserved for drinking only. (11) Not to plant trees near drinking water tanks, nor to make the banks too high. (12) To prevent the people from fouling the banks of the river and of the tanks from which drinking water is taken. (13) To enlist a proper establishment with a sufficient number of carts for the efficient carrying out of the conservancy arrangements of the town. (14) Not to allow rubbish to collect on house lands, but to get all brought out for removal, along with the street sweepings, by the conservancy carts and daily employed in filling up holes and excavations. (15) To have, in addition to the streets, the lanes and bye-paths swept, wheel-barrows being employed where carts cannot have access. (16) To construct public latrines both for males and females at places which are most frequented by the people, particularly in the bazar. (17) To have the latrines for females quite distinct from those for males in separate enclosures with different entrances, and attended to by mehtranis only. (18) If pucca latrines are not built in the first instance, to have the flooring of the latrines made pucca, and to consider the advisability of using corrugated iron for walls. (19) To use two gumlahs in each cell of the latrine—one for the fæces and the other for washings, and to get these gumlahs, the drains, and the walls up to two three feet high tarred at least twice a month. (20) To acquire cultivable land, if possible, outside the limits of the municipality for the purpose of burying the night-soil. (21). To remove the night-soil from the public and private privies twice daily to these grounds, and to bury it in trenches dug in straight lines about one foot deep and one foot wide. Also to warn private mehters not to deposit the soil anywhere except in the trenching grounds. (22) To cultivate the trenching grounds as they get manured. (23) To take steps for the introduction of Part IX of the Municipal Act, particularly in the bazar, as without its assistance night-soil will not be thoroughly removed from private privies, and public health will thus continue to be endangered. (24) To take much trouble in laying out the bazar properly, so that it will be convenient and so constructed as to admit conservancy carts to all parts of it, and to provide it with water and with latrines both for males and females. (25) To consider the advisability of establishing

a proper slaughter-house within the limits of the municipality. (26) To put a stop to the practice among the Mahomedans of burying their dead in the compounds of their houses, and to establish a public burial-ground at a sufficient distance from the inhabited quarters of the town. (27) To see that the clothes, pillows, &c., of the Hindu dead are burnt along with the body, and not thrown into the river, as is at present done. (28) To at once put a stop to the practice of throwing into the river the pauper dead of all classes as well as the bodies subjected to *post-mortem* examinations, and to have all such bodies buried or burnt as the case may require. (29) To consider the advisability of introducing the Compulsory Vaccination Act V (B.C.) of 1880 into the town. (30) To keep separate records of births and deaths occurring within the municipality, and to submit the returns in future to this office. Also to take steps to introduce into it the Compulsory Registration Act.

Action taken on the suggestions.—Besides the cleaning of some of the drains during the rains, no substantial work of sanitation has been taken in hand, but it has been resolved to give effect to all the suggestions gradually as funds are available.

Barisal Town.—*Inspected in February* 1885.—The sanitation of this town was not quite satisfactory. There were grave defects in its sanitary condition, which required early attention. Since the town was last visited, much has been done to improve matters in this direction, but much more remains to be done to place the town on a thoroughly sanitary footing. It appeared that the Commissioners were taking interest in its welfare.

The suggestions were—(1) To divert year after year a much larger portion than 4·06 per cent. of its income in rectifying the grave sanitary defects which still existed. (2) To enforce the sections of Part VI of the Municipal Act which relate to building regulations in the bazar and in those quarters of the town where overcrowding of huts exists. (3) Not to allow the irregular laying out and construction of houses without proper provisions for ventilation or passages between them for admitting conservancy carts. (4) To persevere in the removal of the old encroachments on the bazar road. (5) To have all the pits, hollows, and ditches that are all over the town more actively filled up than is being done at present. (6) To extend gradually the lighting of the streets as funds will permit. (7) Not to allow earth to be dug out of the drains in future, and to take entire control of all drainage channels in the town and prevent rubbish being thrown into them. (8) To get all long-existing encroachments over drains removed. (9) To rectify the defects in the levels of the drains generally which prevents the water from running on freely and smoothly. (10) To endeavour to induce the people to keep the house drains free from vegetation and accumulations of decomposing matter. (11) To keep the ditches and khals scrupulously clear of night-soil and every other offensive matter, so that the rule for tanks in the town to be connected with the tidal ditches may be carried out properly. (12) To utilise the earth that would be available when the Bibi's tank will be dug out next year in filling up holes and excavations. (13) To consider the advisability of removing the weeds from some of the foul tanks, of having some re-dug on account of the silt deposited in them by the river, and of filling up others with *char* earth. (14) To re-dig the tank near the Jews' shop in the civil court compound. (15) To take immediate steps to prevent the contents of the new public latrine near the kotwally discharging into a public tank. (16) Not to trench night-soil so near the tank in which the prisoners bathe. (17) Not to throw dead bodies and carcasses of animals into the river even beyond municipal limits, as it is not fair that the people living there should be subjected to the evils arising from the practice. (18) To adequately increase the conservancy establishment of the town and the number of carts so that all conservancy requirements may be effectually attended to. (19) To have the lanes and bye-paths daily swept in addition to the main streets. (20) To construct more public latrines at place where they are most required, and, before providing these, to apply to this office for plans of latrines as the present plan on which they have been constructed is objectionable. (21) To have the latrines for females quite distinct from those for males, in different enclosures with different entrances. (22) To take steps for the early introduction of Part IX of the Municipal Act to enable the Commissioners to exercise better and more strict control over the construction and cleaning of private privies. (23) To extend to the whole town the system of having private privies attended to by municipal mehtors. (24) To have not only the gumlahs but also the drains and the walls of the public privies to the height of about three feet from the ground tarred at least twice a month. (25) To provide the public latrines with cess-pools and to remove the urine and washings to the trenching ground. (26) To treat simi[illegible] fluid refuse from houses. (27) To have the dry-earth system introduced and proper[illegible] out in the public latrines. (28) To make better arrangements for the disposal [illegible] litter from the cattle-sheds. (29) To direct the overseer to attend to the public l[illegible] carefully, and see that all the suggested arrangements regarding them are properl[illegible] out. (30) To require the owners of the private markets to improve generally th[illegible] of those places. (31) To consider the advisability of establishing a municipal [illegible] house. (32) To see that in the Mahomedan burial-ground the dead are burie[illegible] sufficient depth, so that the chupper, which is usually placed over the corpse, may be four feet below the surface of the ground. Also to ask the Jail Superintendent to see that the graves of the convicts are dug sufficiently deep. (33) To have the pillows, clothes, mats, &c., of the dead burnt along with the body, instead of being thrown about. (34) To consider the advisability of introducing the laws prohibiting the practice of inoculation and rendering vaccination compulsory. (35) To fully utilise the provisions of the Compulsory Registration Act, and to adopt measures generally for improving registration. (36) To

enquire into the causes of the unhealthiness of the portions of the town called Hatkhola and Chamarputty, and to apply the remedial measures required.

Action taken on the suggestions.—(1) Part IX of the Municipal Act has been introduced. (2) Shallow pits and hollows are being gradually filled up. (3) Steps have been taken to improve the condition of the house drains. (4) The Collector has been requested to have the Government tank near the Jews' shop cleared of all weeds. (5) Two conservancy carts have been purchased, and a Dome has been appointed. (6) Two public latrines will be constructed, one in the bazar and the other in Biswassur Babu's mohullah. (7) Tar is being used in the public latrines. (8) One public latrine has been, and the other two will also shortly be, supplied with masonry cess-pools. (9) The trenching system is being properly carried out. (10) The condition of the hât has been materially improved, its floor having been made pucca at a cost of nearly Rs. 500. (11) Steps have been taken to have the clothes, pillows, &c., of the dead burnt to ashes.

Midnapore Town.—*Inspected in March* 1885.—The sanitation of this town was not satisfactory. There were grave sanitary defects, particularly under the heads of drainage and conservancy. The water-supply of the town seemed to me very bad. Under the present system of water-supply Midnapore would, I feared, continue to be affected by serious outbreaks of cholera. A scheme for a good supply of wholesome water in the town seemed absolutely necessary. The arrangements under the head of the disposal of the dead were in some instances objectionable.

The suggestions were—(1) To employ the amount become available by the municipality having been relieved of Police charges in improving the sanitary status of the town, and, in addition, to allot a legitimate share of their remaining income for the same purpose. (2) To gradually fill up the pits and excavations that are common throughout the town with street sweepings and earth. (3) To provide more pucca roadside drains. (4) To attend to the subject of the lighting of the streets, and of the planting of trees on the sides of the principal streets. (5) To take professional advice on the subject of a good drainage scheme, and to have the work carried out gradually to completion as funds will permit. (6) To have the bed of the big khal which passes through the centre of the town so dealt with as to prevent pools of stagnant water, which is really sewage, being formed in the dry season. (7) To utilise the sand that would be available in putting the bed of the khal into order, in filling up pits and foul tanks. (8) To attend to the condition of the street side drains, many of which wanted clearing out, and of the larger drains which were found blocked with rubbish in many places. (9) To raise pucca platforms round the public wells set apart for drinking purposes, so that infiltration of spill water may be prevented. (10) To provide all the wells with buckets and chains for raising water. (11) To prevent the pollution of the banks of the river Cossye from which drinking water is taken. (12) To consider the feasibility of undertaking a scheme for a good supply of wholesome water in the town. (13) To properly supervise the conservancy establishment, to define the amount of work which each man has to perform, and to see that that work is taken from him in full. (14) To have the streets and lanes swept daily and surface cleansing generally properly attended to. (15) To require the owners of cattle sheds to pay attention to their cleanliness and not to permit soakage of urine. (16) To provide one more gumlah in each latrine for washings, and to rectify the defect in drainage. (17) To get the gumlahs and drains of the public latrines tarred at least twice a month. (18) To enquire whether any oppression is exercised by the mehters, or whether their conduct is such as to deter the public from frequenting the latrines, and to check irregularities if they exist. (19) To construct the additional public latrines as early as practicable. (20) In constructing new latrines, to make arrangements to have the buildings for females separate from those for males, and to cause the former to be attended to by mehtranis only. Also to have the approaches to the buildings distinct, so that there would be no meeting of men and women during ingress and egress. (21) To exercise greater vigilence with the increase of public latrine accommodation in putting down promiscuous defœcation. (22) To rectify the defects in connection with the trenching system. (23) To appoint an active and trustworthy overseer who should see that the night-soil is removed from the town and properly disposed of. (24) To induce those who have no private latrines, but can afford the cost of construction, to provide themselves with them. Also to take steps to have those privies which are situated near house wells removed to other sites sufficiently distant from them. (25) To acquire, if possible, cultivable land for trenching night-soil, and when the land has been well manured to have it regularly cultivated by the municipality or farmed out. (26) To close the Mahomedan burial-ground at Mirzabazar as it is much crowded in places. (27) To see that in the municipal burial-grounds bodies are buried in regular lines at fixed distances, so that much space would be saved, and the ground be much more easily preserved from growing into jungle and becoming unsightly. (28) To consider the advisability of removing the Tontiguriah burial-ground to a little south of its present position, so that water would pass from it towards the river. (29) To see that bodies are buried sufficiently deep to allow of the usual chupper over the Mahomedan dead being placed about four feet below the surface of the ground. (30) To deal very cautiously with the question of giving permission to the respectable Mahomedan gentlemen to bury their relatives in the compounds of their houses. (31) When cremations are made, to destroy by fire all pillows, mats, &c., of the dead. (32) To give effect to the proposal of acquiring a plot of land in the jail garden, and of establishing a municipal market thereon. (33) To consider the question of establishing a municipal slaughter-house. (34) To see that good lymph is used by the vaccinator specially at the beginning of the hot weather. (35) To utilise fully

the provisions of the Compulsory Registration Act. (36) To continue the system of requiring the mukhyas (headmen) to report every death or birth occurring within their respective mohullahs. (37) To carry out the *hath-chitti* system more systematically, and to exercise proper supervision over it. (38) To rectify the defect in connection with there being no proper provision for ventilation in most of the lodging-houses.

Action taken on the suggestions.—(1) Trees are being planted on the sides of the principal streets and two malis have been appointed to look after them. (2) Steps are being taken to provide the town with an efficient system of drainage. (3) The khal which passes through the town has been bunded up at Chirimarshai, with a view to clearing the silt below the bund, and preventing pools of stagnant water forming in the dry season. (4) Steps are being taken to improve the water-supply of the town. (5) Pucca platforms will be raised round the public wells, and they will also be provided with buckets and chains. (6) The owners of the tanks near the khal are being induced to have them connected with it. (7) Proper supervision over the conservancy establishment is being exercised through the agency of the several ward committees appointed for the purpose, and the cleaning of the roads and drains are being properly attended to. (8) Steps are being taken for acquiring lands for the construction of public latrines. (9) All the existing public latrines have been provided with additional gumlahs for washings, and the gumlahs and the drains of the latrines are now being tarred twice a week. (10) The conservancy supervising staff has been directed to prevent defœcation on the bank of the river Cossye. (11) The Mahomedan burial-ground at Mirzabazar has been closed. (12) A mehter has been specially appointed to keep the Mahatabpur burning-ground clean, and see that the bodies as well as the clothes, &c., of the deceased are completely burned. (13) A plot of land in the jail garden has been leased for establishing a slaughter-house thereon, and the overseer has been directed to prepare an estimate for the new building. (14) Guriahs (small filthy tanks) are being filled up with street sweepings.

Darjiling Town.—*Inspected in May and June* 1885.—The sanitary arrangements of Darjiling were, on the whole, very satisfactory. Much had been, and was being, done for the improvement of this important sanitarium. The Commissioners were fully alive to its sanitary requirements. I found that the drainage and water-supply arrangements were susceptible of considerable improvement.

The suggestions were—(1) To expend annually a larger share of the municipal income in placing the town on a perfectly sound sanitary footing, specially as a large sum has become available for this purpose by the municipality having been relieved of Police charges. (2) To stop making the excavation on the property of Mrs. Rosamond on the Auckland road, which appeared likely to endanger the stability of the hill-side by bringing down land-slips and blocking the road. (3) To provide cemented drains first in the bazar as much as possible, and to consider the advisability of cementing all those drains that carry cook-room water which, during the dry season, passes between the stones of the existing drains and soaks into the earth and gives rise to foul smells. (4) To have the drain coming down from the Chowrasta, which passes to west of Tendook's house, made pucca for some distance further, so as to prevent the detention of rubbish in the various inequalities of the jhora, and to admit of its being kept clean. (5) To increase the conservancy establishment and the number of carts. (6) To compel the cow-keepers in the Bhooteah busti to remove the cow-dung to a greater distance than at present. (7) To improve the condition of the Bhooteah busti particularly with regard to its conservancy and drainage, and to provide another public latrine near a culvert on the road to Lebong under which the Bhooteahs go to ease themselves. (8) To get the floors of the latrines near the bazar and of that in the Bhooteah busti repaired. (9) To increase the number of latrines for females, and to have these structures entirely separate from those for males in different enclosures, with different entrances. (10) To have the receptacles used in the public latrines tarred regularly at least once or twice a month. (11) To further extend the improved shop accommodation for petty traders in the bazar. (12) To provide additional taps inside both the cattle and sheep-killing houses, so that water may always be running during the process of slaughtering for the speedy removal of blood and to prevent its drying up and clotting in the drain outside. (13) To undertake a close examination of the whole area of supply on Senchal to ascertain what additional springs can be tapped in case of failure of present supply or of an increase being required. (14) Not to take any steps to restrict the water-supply by artificial means as in English towns, but to have it increased, so that the wants of the whole community may be fully met. (15) Not to agree, to any arrangement by which the Government, in the Military Department, will be able to have control over the water-supply of the town, but to take every means not only to guard the present springs, but also to acquire control over others. (16) To communicate with the Conservator of Forests on the subject of planting trees on the hillside near the supply tank No. 8 in the Rungbool Forest Reserve and at other places on which the trees have not naturally been reproduced. (17) To take the greatest care to keep the tanks in the forest free from vegetation. (18) To consider the advisability of improving the present bathing-platform in the bazar by providing a trough on the model of the platforms in use in Calcutta. (19) To see that the Roman Catholic Convent burial-ground, which is situated within the station, is not overcrowded. (20) To fully utilise the provisions of the Compulsory Registration Act, and to adopt measures generally for the improvement of registration of births and deaths.

Action taken on the suggestions—(1) Numerous gaps in fencing have been closed up, old fencing has generally been repaired, and the entire fencing improved by more securely fastening the rails to the posts. (2) Two hundred *cryptomeria* trees have already been planted, and an arrangement has been made with the Superintendent of the Royal Botanical

Garden, Calcutta, for attending to this work during the next ten years. (3) The Bengal Government have been moved to sanction certain bye-laws under section 232 of the Municipal Act for the better control of excavations. (4) The jhora down to Lloyd's Botanical Garden has been converted into a stone drain, and action will now be taken to complete house-connections with it. (5) Experiment will be made of replacing stone drains by those made with glazed tiles. (6) The channel between the cart-road and Ojagir Barber's house has been re-made with stones bedded in lime mortar. (7) The wire-tramway has been completed, and is at work for some months. (8) Three new latrines have been provided in the Judge's bazar on municipal requisition. (9) The drain from the Chowrasta past Tendook's house will receive attention before the end of the financial year. (10) The conservancy establishment and the number of carts have been increased. (11) The cow-dung nuisance in the Bhooteah busti has received attention. (12) The number of latrines for females has been increased. (13) A new public latrine has been provided near the culvert on the road to Lebong, and both the drainage and conservancy of the Bhooteah busti thave been, and will further be, improved. (14) The floors of all public latrines have been repaired. (15) The receptacles in the public latrines are being regularly tarred. (16) The shop accommodation in the central bazar has been increased by the erection of two more barracks. (17) Additional taps have been provided in the slaughter-houses below the Victoria Road, and the slaughter-house in the Bhooteah busti is being kept fairly clean. (18) Arrangements have been made to increase the water-supply of the town. (19) The Conservator of Forests has been communicated with regarding the replanting of trees on the hillside near the supply tank No. 8 in the Rungbool Forest Reserve. (20) The bathing-platform in the bazar will receive the attention it requires. (21) Tanks for dhobis will be provided for in next year's budget.

Nasirabad Town.—*Inspected in August* 1885.—This town was found to be in a bad state. It was full of jungle and of depressions filled with water. Almost all the drains were badly levelled and their outlets were blocked. Houses were seen to be generally arranged round a hole, out of which earth had no doubt been originally taken for building purposes, and which was surrounded by privies and was filled with dirty offensive fluid. The arrangements under the heads of drainage, conservancy, and disposal of the dead were very defective, and in some instances objectionable. On the whole, the sanitary requirements of the town needed much looking after.

The suggestions were—(1) To employ annually a fair share of the municipal income, together with the sum of about Rs. 1,200, which has become available by the municipality having been relieved of Police charges, in rectifying the many serious sanitary defects which yet exist within the municipality. (2) To devise some means for increasing its income. (3) To properly look to the sanitation of certain unhealthy localities of the town, such as Shahara, Kanchijooley, and Kashar. (4) To bring into operation sections 254 to 260, which relate to burial and burning grounds, and Part IX of the Municipal Act. (5) To carry out perseveringly the removal of encroachments upon roads. (6) To fully utilize the street sweepings and the solid refuse from houses for filling up the pits and holes that are common throughout the town, and to take up only so many of the pits, &c., at a time as can be filled up with all possible despatch. (7) To move the Railway authorities to fill up the large excavations by the side of the Railway line. (8) To take steps to improve the condition and levels of the kutcha side drains. (9) To have the question relating to the outlet of drainage settled as soon as possible. (10) To request the Railway authorities to provide sufficient waterway in the place of one of the chief drains closed up by them, as the one already constructed is not sufficient for the purpose. (11) To take early steps to have the encroachments over drains, which are very common in Chota Bazar, where the durzis reside, removed with the exception of the portion necessary for the entrance into shops. (12) To have the scheme for an improved system of drainage carried out gradually, some progress being made every year. (13) To try to improve the condition of the house drains. (14) To select some good tanks in convenient situations, and have them cleared out, protected from pollution, and solely reserved for drinking purposes. (15) To require the owners of private tanks to keep them in proper order. (16) To strictly prohibit the fouling of the banks of the river and of the tanks from which drinking water is taken. (17) To sufficiently strengthen the conservancy establishment and have it well supervised, and to increase the number of carts. (18) To have all the streets and lanes daily swept and the sweepings regularly and properly removed, hand-barrows being employed in the narrow lanes and bye-paths. (19) To require the people to put on the roads at fixed hours all house rubbish, kitchen refuse, &c., for removal by the conservancy carts. (20) To construct more public latrines at convenient places, and to set apart some of them for the exclusive use of females. (21) To provide each cell of the latrines with two gumlahs, one for fœces and the other for washings. (22) To have the gumlahs and the drains and the walls of the public latrines up to three feet high tarred every fortnight. (23) To introduce, if possible, the dry-earth system into the public latrines. (24) To attend early to the defects in connection with the latrine near the dispensary, and to consider the advisability of removing it to some other site. (25) To carry out the trenching system properly, the trenches being dug in straight lines and one foot deep and one foot wide. (26) To open more trenching grounds, as the present one is not conveniently situated with reference to the blocks of privies from which soil is conveyed to it. (27) To request the owner of the Rajah's market to remedy the defects in the place, and to see that the fish market is provided with a good supply of water. (28) To take steps to regulate the traffic in rotten and dry fish, so that it may not prove injurious to

health. (29) To prohibit at once the practice of burying the dead in private compound. (30) To attend to the crowded state of the cemetery for the Christians. (31) To see that is the Mahomedan burial-ground bodies are buried in straight lines and at regular intervals ro prevent waste of space. (32) To stop at once the practice of throwing corpses into the tiver, and to have the clothes, &c., of the deceased burnt along with body. (33) To introduce the Compulsory Vaccination Act V (B.C.) of 1880 into the town, and to appoint a vaccinator to carry on operations within the municipality. (34) To utilize more fully the provisions of the Compulsory Registration Act IV (B.C.) of 1873, and to adopt measures generally for the improvement of registration.

Action taken on the suggestions.—Steps have been taken to fill up pits and excavations. Two public latrines have been put up on the churs in front of the civil station. Steps are also being taken to carry out some of the other suggestions.

Dacca Town.—*Inspected in August* 1885.—The sanitary condition of this town was found to be much better than at the time of the last visit. The Commissioners seemed fully alive to its sanitary requirements, and, in some instances, distinct improvements had been effected. I was very glad to find that three native gentlemen had exhibited highly commendable interest in the welfare of the town by carrying out at their own cost, important sanitary works, foremost amongst which was the extension of the Buckland bund by Babu Rup Lall Dass at an expenditure of over nine thousand rupees. Much, however, had to be done before the sanitation of the town could be pronounced satisfactory. There were still many grave sanitary defects, specially under the heads of drainage, conservancy and disposal of the dead, which required early rectification.

The suggestions were—(1) To make a larger allotment than 3 per cent. of the income for placing the town on a sound sanitary footing. Also to employ, for that purpose, the sum of over Rs. 17,000 which has become available by the municipality having been relieved of Police charges. (2) To utilise more fully the provisions of Part VI of the Municipal Act, which relate to building regulations, to prevent the irregular laying out and construction of houses without any regard to ventilation or crowding. (3) To have the bath-rooms properly connected with the side drains, so that the water from them may not run on to the streets. Also to see that liquid refuse from privies are not permitted to flow over the streets or lanes. (4) To have the waterspouts from the roofs of roadside houses so directed as to discharge into the side drains. (5) To get all encroachments upon roads, in the shape of steps or shop-platforms, removed. (6) To have the kutcha side-drains gradually made pucca. (7) To make persevering endeavours to have all encroachments over and obstructions to drains, removed. (8) To take steps for the removal of jungle by exercising the powers on the subject conferred on them by the Act. (9) To undertake a better and a more improved system of drainage, and to consider the advisability of raising a loan to bring into speedy completion of this highly desirable work. (10) To close all public wells as the filtered water-supply is extended. Also to fill them up after a time when people become indifferent after getting into the way of using the pipe-water. (11) To adequately strengthen the conservancy establishment, and to increase the number of carts and bullocks. (12) After the above has been done, to pay full attention to the conservancy of the town, and to completely supervise the work of this department. (13) To require the owners of cattle-sheds to keep them clean and inoffensive. (14) To require all the residents to bring out within fixed hours all house and kitchen refuse and to deposit on the roadside for removal by the conservancy carts. Also to require them to remove the existing accumulations of rubbish and other filthy matters from within their premises. (15) To construct more public latrines at convenient places, the sites of filled up gors answering well for placing them, and to adopt Hornbury's pattern for the purpose. (16) To take steps for keeping the existing latrines scrupulously clean. (17) To provide, as early as possible, separate public latrines for females, and to cause them to be attended by mehtranis only. (18) With the increase in the public latrine accommodation, to make every endeavour to put down promiscuous defœcation. (19) To make the overseer attend to the public latrines more carefully, and see that all the suggested arrangements regarding them are properly carried. (20) To put up some more public urinals at convenient sites. (21) To get all the private privies without exception cleaned daily, and to induce the owners of such of them as are unprovided with gumlahs and exposed to public view to remedy the defects. (22) To cause the use of well-privies to be entirely suppressed, and to compel their owners to provide for themselves properly-built surface privies with receptacles which can be easily removed and cleaned. (23) To carry out the trenching system properly, and to take steps to get the lands thus manured cultivated. (24) To fully exercise the provisions of Part IX of the Municipal Act in controlling the public and private privies. (25) To take immediate action for acquiring the land required to make a road by which the mehters would obtain access to, and remove night-soil from, gor situated between Lal Chand Mokim's lane and cemetery road. (26) To require the owners of private markets to rectify the defects in those places, and to see that their conservancy is carefully attended to. (27) To consider the advisability of providing a properly built municipal market. (28) To build a proper slaughter-house without delay, to appoint an Inspector, and to allow none but healthy cattle in good condition to be killed. (29) To take up the matter of proper provision of Mahomedan graveyards. (30) To close up at once, with very few exceptions, all private burial grounds, and to prevent all future interments in them. (31) To see that the vault or chupper which is generally placed over the Mahomedan dead is at least four feet from the ground surface 32) To take steps for bringing into operation the Compulsory Vaccination Act V (B. C.)

of 1880 in the town. (33) To fully and carefully utilise the provisions of the Compulsory Registration Act, and to adopt measures generally for improving registration.

Action taken on the suggestions—(1) A great number of sundasses and well-privies have been closed. (2) The filling up of gors has been carried on vigorously. (3) The cartway to the Lukhi Bazar gor has been opened, and the gor is now being rapidly filled up.

Naraingaanj Town.—*Inspected in August* 1885.—Many improvements were found to have been effected since the last inspection of the town, the chief being the provision of more public latrines and the introduction of iron structures for the purpose; the strengthening of the conservancy establishment; the provision of wheel-barrows for the conservancy of the lanes and narrow streets; the acquirement of lands for establishing public burial-grounds; and the appointment of a Registrar to look after the registration of births and deaths. There is yet much to be done to place the town on a proper sanitary footing. The great evil in the sanitary state of Naraingaanj continued to be the innumerable pits and holes of greater or less dimensions; but they were being gradually filled up. The arrangements, too, under the head of the disposal of the dead, as far as interment is concerned, were very objectionable; but steps were being taken to improve matters in this direction. The Commissioners were taking commendable interest in the sanitary welfare of the town.

The suggestions were—(1) To construct a road through the suburb of Madungunge which is an important part of the town. (2) To pay constant attention to the filling up of the worst of the pits and holes, and to press the landowners to do it as speedily as possible with earth in the dry weather. (3) To connect as many of these pits and holes with the river or with the khals as could conveniently be effected. (4) To try to improve the unsatisfactory condition of the existing house drains. (5) To induce the owners of such tanks as cannot be maintained in a wholesome state to have them filled up. (6) To protect scrupulously the banks of the river and of the tanks from which drinking water is taken from being resorted to for defæcation. (7) To further strengthen the conservancy establishment, and to appoint an overseer to carefully superintend the work of this department. (8) To have the bye-paths swept daily and not at intervals as is done at present. (9) To prohibit the throwing of sewage and other offensive matter into deep hollows and ditches, and to require the people to put on the streets or other appointed places all house and kitchen refuse for removal by the conservancy carts. (10) To have the dung from the municipal cow-shed removed outside the municipality and not thrown over the slopes close to the shed to dry up. (11) To provide more public iron latrines at convenient places, and to set apart some of them for the exclusive use of females. (12) To supply one more gumlah to each cell of the kutcha latrines. (13) To try the dry-earth system in all the public privies. (14) To induce those of the people who can afford the cost of construction to provide themselves with properly constructed privies. Also to induce them as well as those who now have latrines to purchase iron latrines of Hornbury's pattern and of sizes suited to their requirements. (15) To make strenuous efforts to put down promiscuous defæcation, specially the fouling of the banks of the Sital Lackhya, when a sufficient number of public privies are provided. (16) To consider the advisability of providing a proper barge for the discharge of night-soil into the midstream of the river during the rainy season, when there is no tidal reflux and thereby getting over the difficulty of trenching in the wet season when it is attended with much trouble. Also to have the night-soil properly trenched during the dry season. (17) To open at once as a public burial-ground the land which was being put into order when I saw it, as part of it was fit for use, and to permit no interments after this in enclosures of houses or in private lands. (18) To take steps from the very beginning to cause the graves in the new burial-grounds to be dug in straight lines. Also to have the bodies buried at a sufficient depth to admit of the chupper, which is usually placed over the Mahomedan dead, being placed at least four feet below the surface of the ground. (19) To provide a burial-ground for the Christians. (20) To consider the advisability of having the Hindu pauper and lunatic dead either burned or buried instead of throwing them into the river Megna, four miles off from town. (21) To give effect to the suggestions made in the last Inspection Report for improving the general condition of the private markets. (22) To establish a municipal slaughter-house. (23) To attend carefully to the conservency of the coolie lines and to see that there is an ample supply of good water. (24) To introduce the Compulsory Vaccination Act V (B.C.) of 1880 into the town. (25) To see that the Registrar specially appointed to look after registration performs his duty properly and carefully.

Action taken on the suggestions—(1) The filthy cess-pool behind the old Railway office has been filled up, and steps have also been taken to fill up the other pits and hollows. (2) The bye-paths are being swept daily. (3) A Mahomedan burial-ground has been provided. (4) The *hath-chitti* system has been introduced in registering births and deaths.

Faridpur Town.—*Inspected in August* 1885.—The sanitary condition of this town found to be as bad as when last inspected about five years ago. No material improvements had been effected under any of the principal heads of sanitation during this long interval. There were many grave sanitary defects, particularly under the heads of drainage, water-supply, and conservancy, which called for early attention. The Commissioners did not seem to have taken that interest in the sanitary welfare of the town which they should have done.

The suggestions were—(1) To allot annually a fair share of the income in additon to the sum of about Rs. 1,600 which has become available to the municipality by its having been relieved of Police charges for placing the town on a sound sanitary footing. (2) To consider the advisability of keeping a smaller balance in hand and utilising the remainder for sanitary requirements. (3) To pay careful and constant attention to the administration of the sanitary clauses of the municipal laws. (4) To level down a foot many of the smaller kutcha roads and utilise the earth for improving the level of the side ditches. (5) To take care that the narrow lanes are not converted into receptacles for filth and other offensive matter of the neighbourhood. (6) To provide additional waterways by bridges and culverts in some of the roads and specially the Jessore road. (7) To make persevering efforts to fill up the innumerable pits and hollows all over the town, and to limit the operation to only so many of them at a time as can be filled up within a short period. Also to connect as many of those pits and excavations with the khals as could conveniently be effected, and to have them regularly flushed during the floods to prevent stagnation of water in them. (8) To put up lights in some of the streets which are overshadowed by trees, and are consequently almost impassable on dark nights. (9) To provide, besides the pucca bridge of three arches, sufficient waterway to let the water of the chief khal flow freely away. (10) To pay greater attention to the drainage of the town, and have levels taken and good outlets of discharge obtained. (11) To prohibit the practice of taking earth from the drains and thereby destroying their level. (12) To have the Julee (khal), which runs from north to south, re-excavated and deepened to get a supply of the river-water all the year round. (13) To require the owners of such privies as are within 50 feet of some of the public tanks to have them removed to a safe distance. (14) To cut down some of the trees near the banks of the Kutcherry tank, and to have the overhanging branches of others removed. (15) To acquire in every village under the municipality at least one of the private tanks, and to get it re-excavated, thoroughly protected and set apart for drinking purposes. (16) To protect carefully the banks of the khal and of the tanks from which drinking water is taken from being resorted to for defœcation. (17) To sufficiently strengthen the conservancy establishment, and to maintain a close supervision over the work of this department. (18) To have all the streets swept daily and the lanes and bye-paths as frequently as possible. (19) To require the people to put on the roadsides at stated hours all house refuse, and to have it regularly and properly removed by the conservancy carts. (20) To fully utilise street sweepings and the solid refuse from houses in filling up pits and excavations and foul tanks. (21) To construct more public latrines at convenient places, and to set apart some of them for the exclusive use of females. Also to provide one good latrine (Hornbury's pattern, made of corrugated iron) for the accommodation of the bazar people. (22) To gradually put down promiscuous defœcation inside municipal limits as more public latrines are provided. (23) To get all the filth of the inhabitants daily removed from their privies and buried in shallow trenches in the cold season and disposed of in the river when full of water. Also to apply Part IX of the Municipal Act to the whole town except the outlying villages where there are convenient fields for resort. (24) To require the owner of the private market to rectify the defects in it. (25) To have the graves in the Mahomedan burial-ground dug sufficiently deep to allow of the chupper which is usually placed over the Mahomedan dead being four feet below the surface of the ground. (26) To get the Mahomedan and Christian pauper, &c., dead buried instead of throwing them into the river as is at present done. (27) To put a stop to the objectionable practice of throwing uncremated bodies into the river. (28) To look after the conservancy of the lodging-houses, and to require their owners to keep the surroundings of those places free from jungle and accumulation of rubbish or filth. (29) To bring into operation the Compulsory Vaccination Act V (B.C.) of 1880 in the town, and to employ the municipal vaccinator not temporarily during the cold season only, but for the whole of the year. (30) To introduce into the municipality the Compulsory Registration Act IV (B.C.) of 1873, and to utilise its provisions properly.

Action taken on the suggestions.—(1) Lights have been provided on three of the important streets. (2) The making of improper excavations within municipal limits has been prohibited under section 232 of the Municipal Act, and the existing pits and hollows are being filled up with street sweepings, &c.

Goalundo Town.—*Inspected in August* 1885.—This town has been constituted a municipality very recently, the Bengal Municipal Act III of 1884 having been introduced into it in January last. It has been rapidly rising into importance as a seat of commerce since the extension to it of the railway and that of the river steamer service. But it is very unfavourably situated with reference to the river Pudma, the encroachments of which necessitate the periodical changing of the site on which the town is built. For that very reason no sanitary work of a permanent nature can, with advantage, be undertaken. The existing sanitary arrangements, however, considering the circumstances of the place, seemed to be unobjectionable. At the time of my visit the whole town and the neighbourhood with the exception of the bazar and a triangle contained between two raised roads and a railway embankment was under water. The municipality was too poor to cope with the natural difficulties which it was subject to

The suggestions were—(1) To get all stagnant pools left by the fall of the river drained off as rapidly as possible by making suitable cuts. (2) To utilise street sweepings and house refuse in filling up such hollows and excavations as might be made for taking earth for building purposes. (3) To introduce corrugated iron latrines in case the Commissioners desire better latrines than their present mat ones. (4) To take steps to inform the Railway

authorities and the steamer companies of the dates of the festivals at Nobodip, when there is a considerable rush of pilgrims through Goalundo to attend them, so that arrangements may be made beforehand for their quick removal. (5) To attend to the latrine accommodation of the pilgrims, trench latrines surrounded with mat walls being put up at convenient places, and to warn them against fouling the banks of the cuttings and of the tanks from which drinking water is taken. Also to adopt measures to isolate cases of contagious or infectious diseases breaking out among the pilgrims. (6) To give special attention to vaccination, and to employ a vaccinator at least during the vaccinating season from October to March, as small-pox is very likely to be introduced through the medium of the pilgrims who halt in this town. (7) To keep a separate record of the births and deaths occurring within the municipality. Also, after the Commissioners have undertaken the registration work in their hands, to bring into operation the Compulsory Registration Act IV (B.C.) of 1873 in the town, and to utilise its provisions properly.

Action taken on the suggestions.—(1) Parts VI, IX, and X of the Municipal Act have recently been introduced into the town. (2) Some more tanks are being excavated. (3) Corrugated iron latrines will be provided gradually as far as the funds will permit. (4) Arrangements have been made to expedite the transport of pilgrims in future. (5) A vaccinator has been appointed since January last to carry on operations.

Julpaiguri Town—*Inspected in August* 1885.—This place has been constituted a municipality only recently. During the interval between its ceasing to be an union and its creation as a municipality, it has suffered somewhat in a sanitary point of view. At the time of my visit, I saw many grave sanitary defects in it, particularly under the head of drainage, which called for urgent rectification. The whole town, except around the houses of the European officials, was overgrown with jungle, which was both high and dense. In fact, I found the place little better in condition than a country village.

The suggestions were—(1) To consider the advisability of devising means to improve its financial affairs, and to devote a legitimate share of its income to sanitary improvement. (2) To take steps for bringing into operation Parts VI and IX of the Municipal Act III (B.C.) of 1884 as they provide most important sanitary regulations, without the application of which it is almost impossible to maintain effective sanitation. Also to bring into force a code of bye-laws framed under the abovenamed Act, in order that the administration of it sanitary clauses may be made more easy. (3) To provide proper roads in those quarters of the town where there want is severely felt by the people, and in constructing new roads to pay special regard to the opening up of some of the crowded and unhealthy localities. (4) To put a stop to the practice of digging pits for taking earth for building purposes, and to make persevering endeavours to fill up the existing depressions with street sweepings and with sand from the riverbed in the dry season. (5) To overcome by the application of the municipal law the opposition of the people to measures calculated to secure cleanliness and general conservancy. (6) To induce the owners of private properties to clear off jungle from their lands. (7) To consider the advisability of providing gradually an improved system of drainage, the most badly-drained portions of the town being taken up first. (8) To have the pits and excavations now full to overflowing with water connected as far as practicable with one another and with the drainage system, not only to carry off as much water as possible, but by keeping it in motion to prevent stagnation. (9) To strictly prohibit the taking of earth from the roadside drains and thereby destroying their levels. (10) To supply a metal bucket, chain, and pulley for drawing water from the public well in the bazar. (11) To require the police to put down defæcation on the banks of the river by reporting the offenders for punishment. (12) To increase the conservancy establishment and the number of carts, and to see that the work of this department is properly supervised by the Nuisance Inspector. (13) To get all the streets swept daily and the lanes and bye-paths at least twice a week, and the sweepings utilised in filling up pits and excavations. (14) To require the owners of cattle-sheds to keep them in a clean and inoffensive condition. (15) To construct some more public latrines at convenient places, and to set apart some of them for the exclusive use of females. (16) To have the receptacles used in the public privies tarred at least twice a month. (17) With the increase of the public latrine accommodation to make every endeavour to put down promiscuous defæcation. (18) To require the private mehters to remove all night-soil to the trenching ground for burial (19) To see that night-soil instead of being pitted is buried in shallow trenches one foot wide and one foot deep, and dug in straight lines, and that only about six inches of night-soil is put into them, the trenches being then covered with earth. (20) To acquire cultivable land at the outskirt of the town for establishing one or more trenching grounds. (21) To require the owners of the private bazar to correct the defects in it. (22 To see that the graves in the Mahomedan burial-grounds are dug in rows with fixed intervals between each grave and each row. (23) To require the fakir, who is in charge of the public Mahomedan burial-ground, to keep registers of all those brought there for interment. (24) To introduce the Compulsory Vaccination Act V (B. C.) of 1880 into the town, and to employ a special vaccinator for carrying on operations within the municipality at least during the vaccinating season. (25) To take over the registration work from the hands of the police, and to fully utilise the penal provisions of the Compulsory Registration Act IV (B.C.) of 1873.

Action taken on the suggestions.—Steps have been taken to introduce Part IX and certain sections of Part VI of the Municipal Act.

Dinajpur Town.—*Inspected in October* 1885.—This municipality was found in a better state than when last inspected. Many improvements had been effected in its sanitary status, but much more still remained to be done in this direction. The conservancy, and the drainage arrangements in particular, were very defective, and required urgent rectification. It was, however, contemplated to shortly provide the town with an effective system of drainage, the entire cost of which, about Rs. 28,000, having been promised by the Maharaja of Dinajpur.

The suggestions were—(1) To largely utilise for sanitary improvements the amount become available by the municipality having been relieved of the cost of maintaining the police. (2) To fill up all pits and hollows with street sweepings and house refuse where earth is not procurable, and to strictly prohibit, under the provisions of the Municipal Act, the making of all future excavations. (3) To take opportunity on the occasions of fires, which are said to be common in Dinajpur, to have the houses built on an approved plan, proper provision being made for ventilation and passages between them for admitting conservancy carts. (4) To have the heavy overgrowth of jungle in parts of the town cut down, or better, up-rooted as fast as possible, and to induce the owners of private properties to act similarly with regard to jungle on their lands. (5) Not to lose any further time in undertaking and bringing to completion the long-contemplated drainage scheme. (6) To have some more tanks situated in convenient localities acquired, re-excavated, and reserved for drinking purposes. (7) To induce the owners of those tanks which are deep enough to retain water all the year round to dewater them and remove the foul debris at their bottoms. Also to prohibit the casting of house refuse and rubbish on the banks of the private tanks. (8) To consider the advisability of providing the wells reserved for drinking purposes with pumps and metal buckets and chains for raising water. (9) To endeavour to prevent the fouling of the banks of the Gagra nullah and of the Puranabhaba river. (10) To sufficiently strengthen the conservancy establishment and to increase the number of carts, so that the conservancy requirements of the whole town may be thoroughly attended to. (11) To have all the lanes and bye-paths swept at least twice a week, and to pay particular attention to their conservancy. (12) To provide barrel carts for the removal of liquid house and kitchen refuse to the trenching ground for disposal. (13) To construct some more public latrines at convenient places, and to set apart some of them for the exclusive use of females; and to consider the advantages of adopting the corrugated iron latrines, Hornbury's patent, sold by Messrs. Burn and Company, of Calcutta, which are very well suited for crowded neighbourhoods, where a small latrine is required and which can be easily kept clean and removed from one site to another. (14) To provide one more gumlah in each cell of the public latrines for urine and washings. (15) To have the gumlahs, the drains and the walls of the public latrines up to three feet high tarred at least twice a month. (16) To efficiently carry out the dry-earth system in all the public latrines. (17) To put up some public urinals in some of the crowded thoroughfares. (18) With the increase in the public latrine accommodation, to make every endeavour to put down promiscuous defæcation. (19) To introduce Part IX of the Municipal Act on an early date, as then the municipality would have complete control over the construction and cleansing of all the latrines. (20) To carry out the trenching system in the manner followed in the jail gardens. (21) To request the owners of private markets to have the floors gradually paved and to keep them in proper order. (22) To consider the desirability of establishing a municipal slaughter-house. (23) To prevent the burial of bodies at random and to see that in all the burial-grounds graves are dug in lines with sufficient spaces between one another. (24) To have the clothes and pillows of the dead burnt along with the body, instead of being allowed to be taken away by the Domes who may offer them for sale in the bazar, and thus unwittingly help the spread of contagious diseases. (25) To introduce the Compulsory Vaccination Act V (B.C.) of 1880 into the town, and to carry on vaccination throughout the year instead of during six months. (26) To bestow special attention to the registration of births and deaths, to specially appoint a person to detect evasions on the part of the people, and to invariably punish the constables under section 6 of the Compulsory Registration Act if they omit to report births and deaths occurring in their beats. Also to consider the advisability of making the tax-collectors enquire into the occurrence of these events and to report them to the municipality, this duty hardly proving a tax on them, as they can easily perform it during the course of their rounds in executing their regular duties.

Action taken on the suggestions.—Several of the suggestions have been adopted, and effect will be given to several others by and by.

Rungpore Town.—*Inspected in November* 1885.—From the backward state into which this town had fallen since my last visit, it was evident that its sanitary condition had not received proper attention at the hands of the Commissioners, and that the conservancy overseer and his establishment had entirely neglected their duty. The drainage was extremely defective, and the water used by the people for drinking and domestic purposes equally bad. The conservancy arrangements were totally incommensurate with the needs of the town, and some of those obtaining under the head of the disposal of the dead were really very objectionable. Decaying vegetation was very abundant, and, to add to the miseries of the place, the food-supply was deficient both in quantity and quality. All these circumstances combined have tended to seriously deteriorate the health status of Rungpore, and to make it one of the most unhealthy towns in Bengal, so much so that over 60 per cent. of the population are said to suffer from malarious fever, which prevails during the greater part of the year.

The suggestions were—(1) To actively look after the sanitary condition of the town, and to consider the advisability of imposing additional taxation for providing funds to carry on sanitary works. (2) To expend on sanitary improvements a part of Rs. 2,300 annually set free by the municipality having been relieved of police charges and a part of the money hitherto spent for the construction, maintenance and repair of roads which, under present arrangement, are kept up by the Road Cess Department. (3) To properly utilise the sections of Part VI, which relate to building regulations and to prevent the irregular laying out and construction of houses without any provision for ventilation or passages between them for admitting conservancy carts. (4) To provide all the roads with sufficient water-way. (5) To perseveringly carry out the work of filling up all deep holes, hollows, and excavations, and to take up only so many of them at a time as can be dealt with with all possible expedition, till they can be filled up, to have the large hollows connected as far as practicable with one another and with the main drainage channels to prevent stagnation of water in them. (6) To prevent, by the strict application of the law on the subject, the making of excavations in future for the purpose of taking earth, &c., therefrom. (7) To see that after trees are planted on the sides of the principal streets they are taken care of and protected from nibbling by cattle. (8) To insist in future on the building of new houses on a better and approved plan. (9) To introduce Dr. Cunningham's Sanitary Primer in all schools maintained and aided by the municipality, so that the rising generation may learn to appreciate the sanitary precautions conducive to the maintenance of health. (10) Not to allow the drainage channel between the Chikli and the Kakrul bhils to get more blocked up with vegetation than at present, and to have parts of it regularly cleaned annually. Also to strictly devote to the maintenance of the channel in good order the revenue derived from farming its fishery. (11) To allow no fishing weirs to be erected in drainage channels, although they may bring in a little additional revenue. (12) To undertake a detailed survey of the town for finding out how the civil stations, Nowabgunge, Dhap, and Mygunge, &c., may be efficiently surface-drained. (13) To grant the small expense which may be required for the proper preparation of the scheme for introducing the Teesta water into the Ghagut river. (14) To bestow earnest attention to the whole question of drainage as so far as it has gone it has proved greatly beneficial to the health of the station. (15) To induce the well-to-do owners to have some of their tanks re-excavated, protected from pollution, and reserved for drinking. (16) To provide all the wells used for drinking purposes with pumps or pulleys and metal buckets for drawing water. (17) To consider the advisability of acquiring at least one tank in every mohullah and of re-excavating, thoroughly protecting, and reserving it for drinking purposes. (18) To adequately increase the conservancy establishment and the number of carts, so that all requirements may be properly and effectually attended to. (19) To provide wheel-barrows for the conservancy of the narrow lanes and bye-paths. (20) To require the people to put on the roads at fixed hours all house and kitchen refuse for removal by the conservancy carts. (21) To have all the main streets swept at least every alternate day, and the lanes and bye-paths twice every week, and to properly utilise the sweepings in filling up pits and holes. (22) To require the owners of cow and cattle sheds to maintain them in a clean and inoffensive state. (23) Not to permit cowdung to be accumulated within the premises, but to have it either converted into cakes for fuel or deposited on the fields as manure. (24) To provide an adequate number of public latrines at convenient places and to reserve a few of them for the separate and exclusive use of females. (25) With the increase in public latrine accommodation, to take steps to put down promiscuous defæcation. (26) To have the gumlahs, the drains and the walls of the public latrines up to three feet high tarred at least twice a months. (27) To keep the public latrines in good repair and to cause the conservancy overseer to see that these places are kept scrupulously clean and swept. (28) To induce those of the people who can afford the cost of construction to provide themselves with properly constructed surface privies with vessels for the reception and easy removal of the night-soil. (29) To introduce Part IX of the Municipal Act on an early date, for the present objectionable arrangements connected with the private privies render it absolutely necessary for the municipality to control and supervise their construction and cleaning. (30) To carry out the trenching system properly as in the jail gardens, and to use gardens and other raised grounds, if possible, for trenching night-soil during the rains, and to induce private gentlemen to make over their gardens for this purpose. (31) To require the owners to provide their markets with proper drains and floors, and to otherwise improve their condition. (32) To consider the advisability of establishing a municipal slaughter-house. (33) To take steps generally for improving the food-supply of the place. (34) To prevent the practice of burying at random and to have the bodies buried in lines with fixed intervals between each grave and each row of graves. Also to see that the vault or chupper, which is usually placed over Mahomedan corpses, is at least four feet from the surface of the ground. (35) To take immediate steps for putting down *intramural* burial. (36) To provide another burning-ground at some convenient place. (37) To have the clothes, pillows, &c., of the deceased burnt along with the body. (38) To overcome the opposition of the people to vaccination by the fuller exercise of the penal provisions of the compulsory law on the subject. (39) To fully utilize the provisions of the Compulsory Registration Act, to appoint a person to detect and report evasions by the people, and to have the evaders and the constables who omit to report deaths occurring in their beats systematically punished under the penal clauses of the law.

Action taken on the suggestions.—No action commensurate with the evils to be remedied has followed the suggestions made. But it is proposed (1) to extend Part IX of the Municipal Act to one part of the town (Nawabgunge) at present. (2) To call upon all householders to remove the bunds across the drains which they now use as pathways to their

houses, as soon as the municipality is in a position to supply suitable Raniganuge drain pipes for the purpose. (3) To issue a general order under section 232 of the Municipal Act, prohibiting the making of excavations without the permission of the proper authorities. (4) To prohibit the erection of fishing weirs on the drains in future. (5) To re-excavate the municipal tank to the east of the municipal garden, and to utilise the earth in filling in the Chandwari tank. (6) To require the owners of the Dhap, Nawabgunge, and Mahigunge bazars to provide drainage, latrine, and water-supply for their markets

Bogra Town.—*Inspected in November* 1885.—Since last inspection in July 1880, many improvements were found to have been effected in the sanitary status of this municipality, the chief being the provision of a public burial-ground for the Mahomedans, the suppression of interments in the compounds of houses, the construction of a public latrine and a urinal, the metalling of the roads, the cleaning of ten wells, the construction of eight kutcha roads and of six pucca culverts, the purchase of two fire-engines, and the provision of two carts for watering the streets. There were, however, still many grave sanitary defects, particularly under the heads of drainage and conservancy. The water-supply question too required very careful consideration.

The suggestions were—(1). To continue to devote a legitimate share of the municipal income to sanitary improvements. (2) To utilise more fully the sections of Part VI of the Municipal Act, which relate to building regulations, in order to prevent the future crowding togethers of huts without proper provision for ventilation or passages between them for admitting conservancy carts, the evil consequences of which may in course of time become very serious. (3) To have all the roads gradually metalled. (4) To consider the advisability of having the denser groves of bamboos thinned out, as health is likely to be greatly benefited thereby. (5) To undertake a proper drainage scheme, and to carry it out gradually, but as rapidly as the funds will allow, and to have the outlets made pucca bye and by. (6) To provide at least one tank in each mohullah in the municipality, and to have it thoroughly protected from pollution and exclusively set apart for drinking. (7) To have the jungle growing on the banks of some of the private tanks removed. (8) To provide the public wells with metal chains and buckets for raising water. (9) To sink some pucca wells at convenient places particularly in the vicinity of crowded localities, and to reserve them for drinking only. Also to induce those of the inhabitants who can afford the cost of construction to provide themselves with properly built masonry wells. (10) To request the Superintendent of the Jail to have the latrine on the bank of the river Karatoya, and belonging to the Jail Department, removed to a safe distance as soon as possible. (11) To adequately increase the conservancy establishment and the number of carts, so that all the conservancy requirements of the town may be properly attended to. (12) To take steps to have all the streets swept daily, and the lanes and bye-paths at least twice a week. (13) To require the owners of cow and cattle sheds to keep them in proper order, and not to allow the ordure to be accumulated within the premises; but to have it either converted into cakes for fuel or removed outside the municipality. (14) To construct more public latrines at convenient places and to have some of them set apart for the exclusive use of females. Also to consider the advisability of adopting the iron latrines, called Hornbury's patent, sold by Messrs Burn & Co., of Calcutta, which are easily managed and consequently less offensive and can be shifted from site to site. (15) To supply two gumlahs to each cell of the new public latrine. (16) To have the gumlahs, the drains, and the walls of the public latrines up to three feet from the floor tarred at least twice a month. (17) To take early steps to suppress the abominable well-privies and to require their owners to provide in their stead properly constructed surface privies with receptacles for the excreta. (18) To take immediate steps for the introduction into the town of Part IX of the Municipal Act, as then the Commissioners would have complete control over the arrangements connected with public and private latrines. (19) To require the private mehters to carry all night-soil to the trenching ground for burial and to prosecute them if they dispose of it otherwise. (20) To carry out the trenching system properly, the trenches being dug in lines one foot wide and one foot deep and only six inches of night-soil put into them, the remainder being filled with earth. (21) To request the owners to provide their markets with drains and proper pathways between the stalls, and to generally keep their markets in a satisfactory condition. Also to require the owner of the Kalitollah market to fill up the hollow to the south end of his market. (22) To consider the advisability of establishing a public slaughter-house on a small scale. (23) To take particular care with regard to the laying out of the graves in the new Mahomedan burial ground, the graves being dug in lines with fixed spaces, between each grave and each row of graves. Also to see that the bodies are buried at a sufficient depth to allow of the chupper, which is usually placed over the Mahomedan corpse being at four feet, instead of two as at present, from the surface of the ground. (24) To make arrangements for keeping the burning-grounds in a satisfactory condition and for preventing such unsightly objects as half-burned pieces of wood, bones, clothes, mats, &c., lying about, and to have the clothes, pillows, and mats of the dead burnt along with the body. (25) To abandon the river-bank and take up another site where the Hindu pauper, &c., dead, and the bodies of certain class of Hindus as well as medico-legal corpses may be buried as the present arrangement might lead to the pollution of the river water. (26) To fully utilise the provisions of the Compulsory Vaccination Act, and to retain the services of the vaccinator for the whole of the year instead of for a few months only, so that the protection of the town from small-pox may be enhanced. (27) To bestow continued attention to the registration of births and deaths.

Rampore Beauleah Town.—*Inspected in November* 1885.—The sanitary arrangements of this municipality were in several respects satisfactory. Commendable sanitary improvements were observed to have been effected in this town since it was last visited. Four public latrines had been constructed; the throwing of corpses into the river had been prohibited, the Compulsory Vaccination Act V (B.C.) of 1880 had been brought into operation, Part IX of the new Municipal Act had been extended to 13 mohullahs of the municipality, two public Mahomedan burial-grounds and a burning ghât had been provided, four main drains had been constructed for the more efficient drainage of the town at a cost of about Rs. 9,000, three metalled roads with a sufficient waterway and thirteen kutcha roads had been constructed, the collection of the vital statistics had been placed under municipal management, a stove had been constructed for fumigating the clothes, &c., of those attacked by cholera or small-pox, one more ground for trenching night-soil had been established, two fire-engines had been purchased and bye-laws prohibiting the construction of houses with roofs and walls of inflammable materials had been framed and brought into force. But several serious defects still existed, particularly under the heads of drainage, water-supply and disposal of the dead, which the Commissioners, with the means at their command, were trying their best to rectify.

The suggestions were—(1) To continue to allot year after year a fair share of the municipal income for correcting the sanitary defects which yet exist. (2) To properly utilise the sections of Part VI of the Municipal Act, which relate to building regulations, so that in future the irregular construction and the consequent crowding together of houses without proper provision for ventilation or for passages between them may be prevented. (3) To gradually metal the kutcha roads. (4) To strictly prohibit the making of all future excavations for taking earth, &c., an ample supply being procurable from the riverbed. (5) To improve the condition of the drains in Shaheb Bazar, and to provide a good set of drains (shallow saucer-shaped ones being much preferred) throughout this valuable and useful property. Also to try to induce householders to keep the drains inside their houses in working order. (6) To have all the tanks filled with river-water every year, inasmuch as it prevents stagnation by providing a fresh supply of water to the tanks; and to induce the well-to-do owners of private tanks to maintain them in proper order and cut down and remove the jungle from the banks of some of them. (7) To immediately stop the practice of throwing bones, carcasses of animals, and offal, &c., from the slaughter-house into the river. (8) To adequately increase the conservancy establishment and the number of carts, so that all the conservancy requirements of the town may be properly attended to. (9) To provide barrel carts for the removal of the fluid-house and kitchen refuse to the trenching ground for disposal. (10) To require the people to bring out at a stated hour all house rubbish, &c, and deposit it on the roadside for removal by the conservancy carts, and to have the existing accumulations of rubbish, &c., removed by the municipality at the cost of the owners. (11) To require the owners of the cattle-sheds to maintain them in a clean and inoffensive state. (12) To provide more public latrines at convenient places and to reserve some of them for the exclusive use of females, and to adopt for future latrines the iron structures called Hornbury's patent, and sold by Messrs. Burn and Company of Calcutta. (13) To have the latrines for the females attending to by mehtranis only. (14) To have not only the gumlahs and the drains, but also the walls, of the public latrines up to three feet from the floor tarred at least twice a month. (15) To properly carry out the dry-earth system in all the public latrines. (16) With the increase in public latrine accommodation, to make every endeavour to put down promiscuous defœcation. (17) To take steps to bring to light the existence of well-privies and to have them closed up. (18) To require the private mehters to bring all night-soil to the trenching grounds for disposal, and to warn them against disposing of it in the present manner. (19) To carry out the trenching system properly, and to try to prevail on the ryots to cultivate jute in such manured grounds in the rains and cold-weather crops such as mustard or wheat in the winter (2) To acquire cultivable land at the outskirt of the town, but within easy reach of the night-soil depôts for establishing one or more additional trenching grounds so that the delay and difficulty now experienced in removing the soil from privies at an inconvenient distance to the present trenching ground may be obviated. (21) After Part IX of the Municipal Act is extended to the whole of the town, to fully exercise the powers conferred on the Commissioners under its provissions of controlling the public and private privies. (22) To require the Conservancy Inspector to closely supervise the work of his department. (23) To have the slaughter-house on the bank of the river at once removed beyond the limits of the municipality, and to cancel the licenses of those slaughtering places as are found to be in a dirty and insanitary condition. (24) To establish a municipal slaughter-house with proper drainage, water-supply, and other conveniences, prohibit, the killing of cattle at any other place, inspect all the cattle brought there to be slaughtered and allow only such of them as are healthy to be killed for food consumption. (25) To lose no time in providing the new burial-ground at Ramchandpore, and to prohibit all further interments in the old one, and moreover have it planted with trees. (26) To request the Mahomedan community to level and fill in all sunken graves which render the public burial-grounds unsightly and insanitary. (27) To strictly forbid burials at places other than the public grounds, and to require the chowkidars attached to the public graveyards to see that the graves are dug sufficiently deep to allow of the chuppor, which is usually placed over a Mahomedan corpse, being at least 4 feet instead of 2½ feet from the surface of the ground. (28) To have the clothes, pillows, &c., of the dead burnt along with the body, and to adopt measures for the proper disposal of the pauper, &c., dead and strictly prohibit the throwing of

the bodies into the Pudma. (29) To stringently enforce all the provisions, particularly the penal ones, of the Compulsory Vaccination Act. (30) To appoint a man specially for detecting and reporting all evasions by the people of the requirements of the Compulsory Registration Act.

Action taken on the suggestions.—The suggestions have been included in the list of improvements to be effected, and they will be taken up as the funds at the disposal of the Commissioners will allow.

Pubna Town.—*Inspected in November* 1885.—The general condition of this town was bad, and parts of it, such as Salgaria and the neighbourhood of the dispensary, were in such a foul, insanitary state that cholera frequently broke out in those localities. It was full of innumerable filthy holes and depressions, which were very prejudicial to health. The drainage arrangements were very defective, and those under the head of conservancy were primitive and most unsatisfactory and objectionable. Unfortunately for the place, the only pure water supply, too, which had been diminishing day by day, and was already below the actual needs of the town, was threatened with utter failure in the near future, owing to the silting up of the river Ichamutty. On the whole, the sanitary welfare of the town required much looking after.

The suggestions were—(1) To employ in sanitary improvement as much as possible out of the sum of about Rs. 2,200, less Rs. 262 for the educational charges, which has become available to the municipality by its having been relieved of Police charges. (2) To consider the advisability of raising the taxes, in order that more funds might be available for rectifying the defects under the various heads of sanitation. (3) To fully utilise the sections of Part VI of the Municipal Act, which relate to building regulations. (4) To take care that the narrow lanes may not be used as a repository for the filth of the neighbourhood, and to provide all the roads with sufficient cross-drains and waterways to allow quick passage to water. (5) To try to come to some arrangement with the zemindar proprietor of the river-bed, so that opportunity may not be lost of advantageously utilising its sand and mud in filling up pits and holes. (6) To repair the pucca drains in the bazar, prevent the shop-keepers using them for the deposit of their house refuse, and to try to have the encroachments over them removed. (7) To undertake a survey of the town with the view of ascertaining the levels according to which drains can be made, inasmuch as an efficient system of drainage is an absolute necessity for the health of the town. (8) To provide properly constructed pucca wells at convenient places, protect them by masonry walls and platforms from inward drainage and infiltration of sewage, and supply them, as well as the existing public wells, with metal buckets and chains for drawing water. (9) To induce rich owners of tanks to have them re-excavated, thoroughly protected from pollution, and reserved for drinking purposes. (10) To at once put a stop to the obnoxious practice of resorting to the river-banks and their neighbourhood for defœcation. (11) To adequately increase the conservancy establishment and the number of carts so that the entire requirements of the town may be efficiently attended to. (12) To require the people to bring out all house rubbish, &c., and deposit it on the roadside for removal by the conservancy carts. (13) To have all the streets swept daily and the lanes and bye-paths at least twice a week, and to fully utilise the sweepings and the solid refuse from houses in filling up pits and hollows. (14) To require the owners of cattle-sheds to keep them in proper order, and not to allow the ordure to be accumulated within their premises. (15) To construct some public latrines at places as are most frequented by the lower orders of the people, reserve some of them for the exclusive use of the females, cause the latrines for the females to be attended to by mehtranis only, supply two gumlahs to each cell of the latrines, one for the fœces and the other for urine and washings, have their gumlahs, drains, and the walls up to three feet from the floor tarred twice a month and keep these places scrupulously clean, otherwise the people will not use them. (16) To take early steps to suppress the abominable well, privies, and require their owners to provide in their stead properly constructed surface privies with receptacles for the excreta. (17) To induce those private individuals who can afford the cost of construction to provide for themselves surface privies which could be cleaned easily. (18) With the provision of sufficient public and private latrine accommodation, to take steps to put down promiscuous defœcation. (19) To have the exposed private privies shut out from public view. (20) To establish a trenching ground at some convenient place, cause night-soil from all the privies to be brought there for burial, strictly prohibit private mehters from disposing of it otherwise, and carry out the trenching system properly. (21) To stringently work Part IX of the Municipal Act after it is brought into operation. (22) To require the owner of the principal private market to have the place swept daily, the drains kept free, and no accumulation of rubbish permitted in or near it, to see that the fish market is kept scrupulously clean and provided with a good supply of water, and to request the owners of the other markets to provide them with proper drains and floors, and take steps generally for improving their condition. (23) To consider the advisability of establishing a public slaughter-house on a small scale (24) To strictly prohibit intramural burials. (25) To insist on burials in the new Mahomedan graveyard being conducted methodically, the graves being dug in lines with fixed spaces between each grave and each row of graves, and the bodies buried at a sufficient depth to allow of the chupper, which is usually placed over them, being at least four feet from the surface of the ground. (26) To see that interments in the ground provided for the Mahomedan pauper, &c., dead are carried on strictly on the plan recommended in the case of the other ground. (27) To have the clothes, pillows, &c., of the dead burnt along with the body. (28) To put a stop at once to the very objectionable practice of throwing

uncremated or partially cremated bodies into the river. (29) To fully utilise the provisions of the Compulsory Vaccination Act and overcome the opposition of the people to the measure by the strict enforcement of its penal clauses, and to take immediate steps to put down the dangerous practice of inoculation by the strict application of the law on the subject. (30) To introduce the system of registering births, separate records being kept of it and returns submitted to this office for information.

Ranigunge Town.—*Inspected in November* 1885.—The sanitary arrangements of this town were not quite satisfactory. Many serious sanitary defects existed, particularly under the heads of drainage, water-supply, and conservancy. In fact, very little was found to have been done to improve its condition since it was last inspected in September 1879.

The suggestions were—(1) To employ annually, in accordance with the orders of Government on the subject, the greater portion of Rs. 1,600 set free by the municipality having been relieved of Police charges, together with a fair share of its remaining income, towards placing the town and particularly such portions of it as Dhobipara, Buteharpati, Sastigoria, &c., on a sound sanitary footing. (2) To take immediate steps to enforce Parts IX and X of the Municipal Act, which have already been introduced. (3) To fully utilise those sections of Part VI of the Act which relate to building regulations so that the crowding together of huts without proper provision for ventilation, scavenging, drainage, &c, may in future be prevented. (4) To put up more lights at places where their want is badly felt. (5) To plant trees on the sides of the principal streets. (6) To carry out the new drainage scheme to completion without unnecessary delay. (7) To have some good deep wells sunk at convenient places, protected from pollution of every kind, and specially reserved for drinking purposes (8) To induce the rich owners of some of the existing tanks to have them re-excavated, thoroughly protected and set apart for drinking and other domestic purposes. (9) To provide all the public wells with buckets and chains with pulleys for raising water, and prohibit the dipping of private vessels into them. (10) To abolish the present scheme of carrying out some of the conservancy arrangements by contract, and have the work undertaken by the municipality. (11) To adequately strengthen the conservancy establishment so that all the requirements under this important branch of sanitation may be properly attended to (12) To provide barrel carts for the removal of fluid kitchen refuse to the trenching ground for disposal where it cannot be carried off by pucca drains. (13) To have rubbish generally more carefully removed and utilised in filling up hollows and excavations, and useless tanks which become very foul when drying up. (14) To induce the people to store for manuring purposes cow-dung, &c., outside the town on their fields and not in their houses. (15) To have the distilleries removed, if possible, outside the limits of the municipality, so that their refuse water may not constitute a nuisance as at present. (16) To supply two gumlahs to each cell of the public latrines. (17) To have not only the drains but also the gumlahs and the walls of the latrines up to three feet from the floor tarred once a month. (18) To provide one or two latrines for the exclusive use of females who will not freely resort to those which are also frequented by the opposite sex. (19) To see that the public latrines are kept scrupulously clean and swept. (20) To provide more conveniently situated public latrines, and when this is done to try to put down promiscuous defœcation. (21) To take early steps to fully utilised the provisions of Part IX of the Municipal Act which have already been introduced. (22) To abandon the plan of trenching the night-soil in the vicinity of the public latrines, and to provide one or two sufficiently large grounds for this purpose in the outskirts of the town, but conveniently situated with reference to the blocks of privies from which the soil is to be conveyed to them. (23) To have the trenches for burying the night-soil dug in lines one foot deep and one foot wide, put only about six inches of night-soil into them, the remainder being covered with earth, and cultivate the ground, manured by the above process, with strong plants such as sugarcane, maize, &c. (24) To establish the proposed meat market as soon as possible, and consider the advisability of providing a public slaughter-house on a small scale with proper drainage, water-supply, and other conveniences, and prohibiting the killing of cattle at any other place. (25) To utilise the unoccupied spaces between each grave and each row of graves in the burial-ground for the Christians. (26) To stop the practice of throwing the pauper dead on the fields at a distance from the town, and have the bodies either burned or buried in accordance with the religious persuations of the diseased. (27) To strictly enforce the provisions of the Lodging-house Act, and see that these resting places are maintained in a clean and wholesome condition. (28) To carefully look after the sanitary condition of the coolie depôts and require their owners to keep them in proper order. (29) To fully utilise the provisions of the Compulsory Vaccination Act. (30) To strictly work the Compulsory Registration Act, particularly with reference to the penal provisions, specially appoint a person to detect and report all evasions by the people of the requirements of the law, and have the constables punished under section 6 of the Act whenever they omit to report the deaths occurring in their beats.

Hazaribagh Town.—*Inspected in December* 1885.—This municipality was in fair order, the roads were good and the drains generally open. Some improvements had been effected in the sanitary status since it was last inspected; but much more yet remained to be done in this direction. On the date of my visit there were, however, evidences to show that the Commissioners were anxious to do their best, with the means at their disposal, to improve the sanitation of the town.

The suggestions were—(1) To allot systematically year after year a legitimate share of the municipal income for placing the town, particularly such portions of it as Mulla Tola

and the outlying villages, on a thoroughly good sanitary footing. (2) To fully utilise the sections of Part VI of the Municipal Act, which relate to building regulations. (3) To provide a new street in the gowala quarter and some more in Khirgaon, and in constructing them to take steps to open up some of the crowded parts of these localities. (4) To have the encroachments over the pucca drains in Baribazar and Mungalbazar removed, prevent these drains being built over in future, continue the construction of the pucca walls on both sides of the main nullah or central drain until it is improved throughout its whole length, and to take steps to have the gowala quarter efficiently surface-drained. (5) To have the swamps in front of the Civil Surgeon's house under the artificial lake either made into a lake itself or thoroughly drained. (6) To supply all the wells, specially set apart for drinking, with buckets and chains for raising water, have the well in the Mahomedan burial-ground immediately closed against the supply of drinking water, and provide a few wells for the inhabitants of Khirgaon, and have them duly protected from all sorts of pollution and reserved for drinking and other domestic purposes. (7) To further increase the conservancy establishment so that all conservancy requirements of the town may be properly attend to. (8) To have all the lanes and bye-paths swept at least twice a week. (9) To construct some more public latrines at convenient places, and reserve some of them and one or two of the existing ones for the exclusive use of females. (10) To supply two gumlahs to each cell of the latrines, and have their gumlahs, drains and the walls up to 3 feet from the floor tarred twice a month. (11) To properly carry out the dry-earth system, and take steps to keep the privies scrupulously clean and sweet. (12) To endeavour to put down promiscuous defœcation. (13) To introduce Part IX of the Municipal Act on an early date so that the Commissioners will be in a position to thoroughly control and supervise the arrangements in connection with the public and private privies. (14) To stop the objectionable practice of throwing the night-soil on the surface of the ground to dry up, and substitute the trenching system in its stead. (15) To have not only the clothes of the deceased, but also the pillows, mats, &c., burnt along with the body. (16) To stringently work the Compulsory Vaccination Act, and retain the services of the vaccinator for the whole of the year instead of for a few months only. (17) To fully utilise the provisions of the Compulsory Registration Act, specially appoint a person to detect and report all evasions of the requirements of the law, and deal with the constables under section 6 of the abovenamed Act, whenever they omit to report births and deaths occurring in their beats.

Ranchi Town.—*Inspected in December* 1885.—The general sanitary condition of this town was satisfactory. The roads were good, and the shallow surface drains in order. There had been a good deal of tree-planting which will be a great comfort to the people when the trees grow to a fair size. There was, however, room for improvement under the head of conservancy, the arrangements under the other heads of sanitation being all that could have been desired.

The suggestions were—(1) To employ annually the greater portion of the saving effected by the municipality having been relieved of Police charges, together with a legitimate share of the remaining income, for improving the sanitary condition of the town. (2) To have the tank in the bazar near the thanna either maintained in proper order or filled up, and prohibit the fouling of the banks and the neighbourhood of the tanks from which drinking water is taken. (3) To take steps to prevent the soakage of foul water in the vicinity of the wells set apart for drinking. (4) To have all the lanes and bye paths swept at least twice a week, and see that they are not converted into repositories of filth, &c., of the neighbourhood. (5) To cause the public latrines to be kept scrupulously clean and sweep, and consider the advantages of adopting for future latrines the iron structures called Hornbury's patent and sold by Messrs. Burn and Company of Calcutta. (6) To have the drains, the receptacles, and the walls of the public latrines up to three feet from the floor tarred thrice a month, and see that the dry-earth system is properly carried out in all of them. (7) To bring into operation Part IX of the Municipal Act, as then the Commissioners would have complete control over the public and private privies. (8) To avoid deep trenching, and have the trenches dug in lines one foot wide and one foot deep and only six inches of night-soil put into them, the remainder being then filled with earth. (9) To take early steps to bring the Compulsory Registration Act into force, and when the law is introduced, to have it strictly worked and the overseer and tax-collectors required to detect and report all evasions of the requirements of the Act.

Chybassa Town.—*Inspected in December* 1885.—The sanitary arrangements of this municipality were not found quite satisfactory, many serious sanitary defects existing, particularly under the heads of conservancy and water-supply. In fact, it appeared that very little had been done to improve the sanitation of this town since it was last visited in January 1881.

The suggestions were—(1) To devote year after year in accordance with the orders of Government on the subject, the greater part of the saving effected by the municipality having been relieved of police charges, towards rectifying the grave sanitary defects which exist in it. (2) To introduce Parts VI and IX of the Municipal Act, as they provide most important sanitary regulations without the application of which it is almost impossible to maintain efficient sanitation. Also to bring into force a Code of bye-laws framed under the abovementioned Act. (3) To gradually deal with the encroachments over the pucca drains in the bazar so that the sweepers can properly clean out the drains, to cause either openings

to be made in masonry structures or have them curtailed in length, and to continue to completion the construction of the shallow saucer pucca drains in the Sudder Bazar. (4) To repair the breaches in the embankments of the Modhu tank and the temple tank, and remove the flowering plants and all vegetation from the banks of the latter, as it seems the one most likely to yield a good supply for drinking. (5) To have the sweepings which had been thrown near the lake and in its catchment area, and which still remains unremoved, at once burned and the ashes swept into the quarry holes near. Also to remove from its edges all vegetation, and plant, no more trees the leaves of which can find access to the water. (6) To request the owners of foul tanks either to maintain them in proper order or to have them filled up. (7) To erect pucca platforms round the public wells so that the soakage of foul water in their vicinity may be prevented, and to provide when funds permit two or three good deep wells at convenient places, have them reserved solely for drinking, supply them as well as the existing ones with buckets and chains, and permit no dipping of private vessels. (8) To strengthen the conservancy establishment as proposed, and see that surface cleansing is properly attended to. (9) To take steps for the proper disposal of refuse water and dead worms if silk filatures are to be started here. (10) To have the distilleries removed outside the town as the refuse discharge from them is liable to be offensive to the people. (11) To construct more public drains at convenient places, and have some of them reserved exclusively for the accommodation of females. Also to consider the advantages of introducing the iron latrines called Hornbury's patent and sold by Messrs. Burn and Company of Calcutta. (12) To supply two gumlahs to each cell of the public latrines, and have the gumlahs, the drains, and the walls up to three feet from the floor tarred at least twice a month. (13) To properly carry out the dry-earth system in the public latrines. (14) With the gradual increase in public latrine accommodation, to take steps to put down promiscuous defœcation as far as practicable. (15) To have all night-soil from private privies removed outside the town and buried in shallow trenches in lands which should afterwards be cultivated, rice fields doing very well in the dry season, higher lands in the rains. (16) To see that the soil from the public latrines is properly trenched in the ground assigned for the purpose. (17) To at once put a stop to the objectionable practice of burning bodies at random, and have the graves dug in lines with fixed distances between each grave and each row of graves. Also in the case of the Mahomedans, to cause the bodies to be buried at a sufficient depth to allow of the chupper, which is usually placed over the corpse being at least four feet from the surface of the ground. (18) To bring the Compulsory Vaccination Act V (B.C.) of 1880 into force, in order that vaccination may be more systematically pushed on. (19) To take early steps for introducing the Compulsory Registration Act into the town.

Action taken on the suggestions.—(1) Application has been made to Government for extending Part VI of the Municipal Act. (2) As soon as the abovementioned part of the law is introduced, a Code of bye-laws will be drawn up. (3) Orders have been issued to have the sweepings deposited near the lake burned at once and the ashes swept into the quarry holes near. (4) The owner of the temple tank has been asked to repair the breach in its embankment. (5) Provision has been made in the coming year's (1886-87) budget for improving the condition of the existing wells and for sinking new ones at places. (6) The conservancy establishment has been increased by two mehters and two carts, and will be further increased next year. (7) Steps are being taken to introduce Hornbury's patent iron latrines. (8) The receptacles in the public latrines will be tarred. (9) The night-soil from the private privies is being removed outside the town, and provision will be made for its proper disposal. (10) The night-soil from the public latrines is being properly trenched. (11) Provision will be made in the bye-laws to be framed under Part VI of the Municipal Act for the proper control and management of both burial and burning grounds. (12) A proclamation has been issued calling upon the inhabitants to keep their compounds clear of jungle, and offenders are now being prosecuted. (13) The "midden" question will receive early attention.

Purulia Town.—*Inspected in December* 1885.—The general condition of this municipality was fair, and the arrangements under several of the heads of sanitation were satisfactory. The Commissioners had been exhibiting commendable interest in its sanitary welfare, and many reforms were found to have been effected since it was last visited. The water-supply and conservancy arrangements, however, were susceptible of considerable improvement.

The suggestions were—(1) To continue to allot year after year a fair share of the municipal income for rectifying the sanitary defects which yet exist. (2) To make every endeavour to keep the lake clean, and effect this to a certain extent by cutting down the trees on the islands which at certain seasons are the resort of numerous water-fowl, whose droppings must be injurious to the purity of the water. (3) To induce the rich owners of some of the private tanks to have them re-excavated, properly protected from pollution, and reserved solely for drinking and culinary purposes. (4) To have all the wells, which are used for drinking, surrounded by masonry parapets, and provided with platforms, and drains to carry off spill-water from their neighbourhood, supply all of them with buckets and chains for raising water, and permit no indiscriminate dipping of vessels in them. (5) To further strengthen the conservancy establishments so that all conservancy requirements of the town may be completely attended to. (6) To provide barrel carts for the removal of fluid kitchen refuse to the trenching ground for disposal. (7) Not to allow cattle ordure to be accumulated within compounds of houses, but to require the people to have it either converted into

cakes for fuel or deposited on the fields as manure. (8) To prohibit tanning of hides within the town, and consider the advantages of having brick-kilns far off from it, as the holes dug are liable to become offensive in several ways. (9) To construct some more public latrines at convenient places, and have two or three of them reserved for the exclusive use of females. (10) To supply two gumlahs to each cell of the public latrines, and have the gumlahs, the drains, and the walls up to three feet high tarred twice a month. (11) With the gradual increase in public latrine accommodation, to take steps to put down promiscuous defœcation. (12) To carry out the trenching system properly, and keep the cultivation of the trenching grounds always in view. (13) To immediately stop the practice of burying at random, and enforce burials in regular rows with fixed intervals between each grave and each row of graves; and in the case of the Mahomedans see that the graves are dug sufficiently deep to allow the chupper to be at least four feet from the surface of the ground instead of 2 or 2½ feet. (14) To introduce the Compulsory Vaccination Act, and fully utilise its provisions when brought into operation. (15) To take early steps to bring the Compulsory Registration Act into force, and when this enactment has been introduced, specially appoint a person to detect and report evasions of its provisions by the people, and get the constables or other persons appointed to report the births and deaths occurring in their beats punished under section 6 of the Act when they omit to perform this duty.

Bankura Town.—*Inspected in December* 1885.—Since it was last inspected, much had been done to improve the sanitation of this municipality; but there were yet several sanitary defects, particularly under the heads of drainage and disposal of the dead, which called for rectification. It was interspersed with several filthy tanks called *gorias*, the foul emanations from which greatly tended to vitiate the atmosphere, and parts of it, such as Poddar mohullah and Tanti mohullah were in a very insanitary state attended with risk of disease. There was, however, evidence at my visit to show that the Commissioners were taking an intelligent interest in the sanitary concerns of the town committed to their care.

The suggestions were—(1) To continue to allot a fair share of the income for placing the town on a thoroughly sanitary footing. (2) To take opportunities on the occasion of fires, &c., to widen the narrow lanes. (3) To extend the pucca shallow side drains as much as possible through the town, particularly in lanes where there was a considerable discharge from bath-rooms and cook-houses. (4) To strictly prohibit all future encroachments over drains. (5) To take steps to remedy the defect noticed in respect of those houses which have no drains at all, their levels being much lower than those of the public drains. (6) To fill up all the *gorias* gradually, but perseveringly, with street sweepings and the solid refuse from houses, and to take up only so many of them at a time as could be dealt with within a short space of time. (7) To strengthen the conservancy establishment. (8) To provide barrel carts for the removal of the fluid kitchen refuse to the trenching ground for disposal. (9) To employ wheel-barrows for the effectual removal of all filth and sweepings from the narrow lanes and bye-paths. (10) Not to allow the cow-house dung and refuse to be accumulated within compounds of houses, but to require the people either to convert it into cakes for fuel or deposit on the fields as manure. (11) To have the refuse dye from lac factories carefully removed. (12) To provide some more public latrines at convenient places, and have some of them reserved for the exclusive use of females. (13) To supply two gumlahs to each cell of the public latrines. (14) To provide a pucca cess pool at the kutcherry latrine. (15) With the gradual increase in public latrine accommodation, to make endeavours to put down promiscuous defœcations. (16) To extend to the whole town the scheme, already partly initiated, of cleaning private privies through municipal mehters, and take early steps to introduce Part IX of the Municipal Act. (17) To establish one or more trenching grounds conveniently situated with reference to the blocks of privies from which the soil is to be conveyed to them, see that all night-soil from both public and private privies is removed there for burial, carry out the trenching system properly as in the jail garden, and, when a part of the ground is manured, have it cultivated. (18) To consider the advisability of establishing a municipal slaughter-house beyond the limits of the town, where all cattle might be killed, and the meat only brought to the town for sale. (19) To at once stop the practice of burying the bodies at random in the Mahomedan graveyard, and enforce burials in lines with fixed intervals between each grave and each row of graves. (20) To have the *akhras* or the private burial-ground of the Boistobs either registered or abandoned. (21) To fully utilise the provisions, particularly the penal ones of the Compulsory Registration Act, specially appoint a person to detect and report all evasions of the requirements of the law by people, and get the constables punished under section 6 of the enactment whenever they omit to report births and deaths occurring in their beats.

Suburbs of Calcutta.—*Inspected on 19th, 20th, 21st, 23rd and 24th November* 1885 *and* 31*st December*.—The sanitary status of this municipality was deplorably bad. Indeed it was found to have maintained the insanitary conditions of former years. Grave defects existed under almost every head of sanitation. The bustis were mostly overcrowded, badly drained, full of foul tanks and cess-pools, and extremely filthy—in short, they were in a horrible condition. The drainage arrangements were most unsatisfactory. There were no drains at all in several places, and of those that existed, the main channels were no better than deep ditches without proper levels and containing sewage of all kinds, and the side drains to the roads were for the most part out of order, blocked with rubbish and obstructions, and full of black, stinking slush in places. The arrangements obtaining under the head of conservancy were totally incommensurate with the needs of the town and very

objectionable in several respects. The water-supply question demanded the serious consideration of the Commissioners. The supply itself was insufficient and the water used for drinking and culinary purposes was in the majority of cases, and particularly in the bustis, of the worst quality, being little better than diluted sewage. Surface defilement was very great, and the soil in several places was saturated with all sorts of organic impurities. The arrangements in connection with burials were most objectionable and fraught with danger. In short, all the elements most prejudicial to health abounded in this municipality, to the reproach of the Commissioners and as a standing menace to the health of the metropolis of British India.

The suggestions were— (1) To carry out the important sanitary works for which provision has been made in the current year's (1886-87) budget, and the need for which is very great. (2) To administer the sanitary provisions of the Municipal Act with greater activity and closeness than at present. (3) To take steps to keep the Haldar Bagan gowala busti clean, remove all cow-dung from the drains, fill up all cess-pools and hollows in it, and properly protect the tank from inward drainage. (4) To adopt measures generally to improve the conditions of the Malapara bustee. (5) To prevent overcrowding in the Haritolla and Tantibagan bustis, and maintain them in a proper sanitary condition. (6) To provide the new Kobidanga busti in Garden Reach with proper roads and drainage. (7) Not to allow the Sitaram busti which had been improved and properly laid out, to deteriorate in condition. (8) To take early steps, improve the sanitary condition of the Gungaram and Woolfut Bagan bustees. (9) To prevent over crowding in and improve the sanitation of the busteo, outside the limits of the Kalighat temple. (10) To take immediate steps to open out roads for conservancy carts in the Narkul Bagan busti, raise the banks of the tanks, and see that rubbish is daily completely removed from it. (11) To make proper drainage and conservancy arrangements in Chitpore and Cassipore. (12) To improve the sanitary condition of the Nikaripara village. (13) To rectify the very grave sanitary defects which exist in the Bengali bazar and the Dhankheti and Jaradkhoti village, the property of the ex-King of Oude. (14) To convert as much as possible all deep side drains to roads into shallow surface drains. (15) To have all encroachments on the roads removed, and prohibit all future ones. (16) To put the roads in Sitaram bustee, into proper order. (17) To fill up all excavations as soon as practicable; call upon the zemindar of Sitaram bustee, to explain why he gave permission to the woman named Sonya to make an excavation to take earth from it to build a new house without the consent of the municipality, and take care that this irregularity does not occur anywhere. (18) To see that the process of filling up the tank in Peepulputty is carried on properly. (19) To provide the Shahibbagan and Rajabagan villages with an efficient system of drainage, keep the municipal drain in the former in working order, and see that in the latter the houses with their privies do not drain into tanks in proximity to them. (20) To throw more earth and cinders in the tank in Sealdah station which had been filled up, so that the sinkage may be made up and the drainage channel which runs across it act properly. (21) To remove, according to the provisions of the law, all encroachments over the drain on the south side of the road in Moulaly Durga which discharges its contents into the Mahratta ditch. (22) To put the Mahratta ditch into order and prohibit the throwing of rubbish into it. (23) To keep the drain passing the house of Mr. D. W. Manly, of No 1, Police Hospital lane, in a proper working order, and remove the black sludge from its bottom. (24) To have the Tantibagan, Nikasi drain and the blocked drain on the west side of the busti cleared of obstructions and made free to act. (25) To have the drain which receives the contents of the drainage of the east side of Garden Reach, Circular Road, and of Kali bagan abuting that road, cleared and put into order, and all filth in it removed. (26) To adopt means to prevent the evil arising out of the chief road of the Kalidanga busti, which crosses the public drain of the Garden Reach Road, which has been filled in for the purpose, blocking all drainage from the northwards. (27) To carefully enquire into the working of the establishment entertained for keeping the drains in Watgunge and Garden Reach clean and effective. (28) To prohibit the taking of earth from the drains in front of houses in Gungaram and Woolfut bagan bustis, and put the drains in order. (29) To attend to the drainage of the locality to the south-east of the temple in Kali Ghât, which seems to be generally towards tanks. (30) To see if the drainage of Modoo Haldar's bagan can possibly be improved. (31) To have the pucca covered drain in Sitaram busti, which passes parallel to the General Hospital compound and conveys the water of the maidan to Tolly's Nullah, cleared out (32) To have the planks over the drain passing through Pora bazar on the Peepulputty road removed and the filth cleared out, and carry out the suggestions offered for improving the drain in Surrup Poddar's bazar. (33) To take action, in communication with the Public Works Department, to remedy the evil arising out of the insufficient provision of waterway to the drainage near the Chitpore lock on the Sathpukur road. (34) To put to order the existing drains, and provide new ones wherever required, in Nikaripara village, Kasia bagan, Cassipore, and Barritolla, Chorguard, and Pan bagan bustis. (35) To do away with the present scheme of carrying out the conservancy arrangements by contract, and undertake the work themselves by means of their own salaried servants. (36) To pay serious and continuous attention to the early reclamation of the untouched bustis. (37) To see that the accumulations of foul water and slush in almost every house in the Shahebbagan busti are removed and properly disposed of. (38) To have road sweepings and rubbish carted away daily and not permitted to accumulate in places and form middens, wheelbarrows being used in lanes and bye-paths to which the carts cannot have access. (39) To get

all pits, hollows and excavations systematically, and properly filled up. (40) To require the people to bring out daily all house rubbish and kitchen refuse, and deposit them on the roads for removal by the conservancy carts. (41) To put a stop to the imposition of a double impost for frequenting public latrines, viz., the fee paid to the zemindar and the house service fee paid to the municipality. (42) To provide more public latrines at convenient places, more particularly in the bustis, construct them on approved plans, the plan of canal latrine No. 4 being preferable, and introduce Hornbury's patent iron latrines. (43) To provide separate latrines for the exclusive use of females instead of assigning compartments for them in latrines frequented by males. (44) To see that the existing latrines are kept scrupulously clean and the excreta and urine removed from them more frequently, initiate the manner in which the cleanliness of canal latrines No. 4 is attended to, and have those latrines which are contracted in accommodation either enlarged or domolished and other commodious ones erected in their place. (45) To supply a sufficient number of vessels for the night-soil in the latrine at Kalighat. (46) To increase the latrine accommodation at Kobidanga, and provide the existing latrine of the place with a pucca reservoir. (47) To see that the zemindari latrine in Dugdugipara in Banapukur is provided with vessels for receiving the solid fœces. (48) To have the vessels, drains and walls of the public latrines tarred at least once a month. (49) With the provisions of an adequate number of free public latrines, to take steps to put down promiscuous defæcation. (50) To set up urinals in the most thickly-populated parts of the municipality to obviate surface defilement. (51) To encourage the people to provide for themselves better constructed privies than the present wretched structures. (52) To have the cleaning process of the private privies more carefully attended to by the municipal mehters, and the condition of the privies more frequently inspected than at present. (53) To avoid deep pitting of night-soil and carry on the trenching system properly. Also to encourage cultivation of the trenching grounds. (54) To open additional conveniently situated trenching grounds, as the present ones are insufficient and not conveniently situated with reference to the privies from which soil is conveyed to them. (55) To see that fish in a bad state is not offered for sale in the Moulaly bazar, and prohibit the sale of beef of very inferior quality at the Kidderpore market. (56) To take steps to improve the condition of Kali bazar. (57) To have the pump attached to the tank from which water is supplied to the slaughter-house at Sonadanga repaired. (58) To arrange, as far as possible, that offensive and dangerous trades, such as soap and oil-boiling, tanning, &c., be carried on beyond municipal limits, as they add, more or less, to the other conditions injurious to health, which already obtain in the municipality. (59) To strictly prohibit the keeping of pigs in Haldar bagan in Tengra. (60) To see that the dung from the several sheep pens in Korryah busti is regularly removed for disposal, and not allowed to accumulate and rot till the cold weather, to be then sold as garden manure. (61) To see that all the tanneries in Mocheepara busti and in the Maniktolla burial-ground are provided with proper outlets for the discharge of refuse water, and that none of them empty into tanks from which water is taken for drinking. (62) To open out and maintain in efficient state Nos. 4 and 5 main drains in Kooryah busti and No. 7 drain in Dugdugipara, which receive the refuse discharge from the tanneries in those localities. (63) To have the drain near the tanneries of Messrs. Monteith and Company and Messrs. Zanini and Company cleared of stinking fluid, and put the public drain with which the above drain is connected into proper working order. (64) To have the evils described under the head of cattle-shed nuisance corrected generally and systematically. (65) To require the police to cut down the peepul-trees planted by them on the side of the tank behind the police phari at Kalighat. (66) To direct the zemindar of Sitaram busti to cut down the trees planted by him on the edge of one of the village tanks. (67) To take steps to prevent the fouling of the large tanks in the Nikaripara village, as well as that of the canal, from the drainage discharge into them of the huts along the banks in the case of the former, and of all the bustis in this village in that of the latter respectively. (68) To have some of the filthy private tanks in Kamerdanga dewatered and cleaned out by the owners or by the municipality at their expense, and the others as well as the excavation I saw filled up. (69) To see that earth is properly spread over the banks of the tank in Malye busti, which was commenced to be dug last year, so that inward drainage from the neighbouring houses on its north side may be prevented and the low land and several very bad holes on the south side filled up. (70) To look after the water-supply in Gungaram and Woolfutbagan. (71) To provide in the localities which will not be affected by the Calcutta water-supply scheme properly constructed and well-protected tanks, or good deep wells, provided with parapets, with buckets with chains and pulleys and with sloped platforms to carry off the spill water to the nearest drain, and have them exclusively set apart for drinking purposes. (72) To assign separate tanks for ablution, washing of clothes, &c. (73) To require the owners of such of the private tanks as are worth preserving to clean and protect them from future pollution and to have the others filled up. (74) To see that in the case of the Mahomedans the graves are dug deeper, so as to admit of the chupper being at least four feet from the surface of the ground. (75) To close the larger portion of the Maniktolla burial-ground which is close to the Circular Road, and is much overcrowded, the ground being used again and again, and prohibit further interments in the spoil bank thrown up from the canal, as this portion also is overcrowded, and, moreover, situated among buildings. (76) To abandon the Ekbalpore and Cossipore burial-grounds if they are found overcrowded, and close the Teljulla ground for Mahomedans and Boistobs, and the Cassipore graveyard as they are much overcrowded. (77) To bestow immediate attention to the question of

taking up lands outside the municipality for establishing new burial grounds. (78) To exercise more energetic and sustained supervision over the registration of births and deaths occurring within the municipality, so that accurate results may be obtained, and specially appoint a person to detect evasions of the provisions of the Compulsory Registration Act by the people and omissions to report births and deaths by the constables, and systematically prosecute defaulters, under the provisions of the law, on behalf of the municipality.

APPENDIX No. V.

STATEMENTS EXHIBITING PARTICULARS REGARDING THE VACCINE OPERATIONS OF THE YEAR 1885-86 AND OTHER INFORMATION CONNECTED THEREWITH.

STATEMENT No. I.—*Showing particulars of Vaccination in each*

Number.	Circles and Districts.	Population.	Average population per square mile.	Average number of vaccinators employed throughout the season.	Total Number of Persons Vaccinated. Males.	Females.	Total.	Average number of persons vaccinated by each vaccinator.	Primary Vaccinations. Total. Males.	Females.	Total.	Success. Under one year.	One year and under 6.

OFFICE OF SANITARY COMMR. FOR BENGAL,
The 15th May 1886.

CHAPTER XIII.

Howrah.

I—Situation, boundaries, area, population and administration.

The district of Howrah is situated in the south-east of the Burdwan Division. It lies between 22°13′ and 22°47′ north latitude, and between 87°51′ and 88°22′ east longitude. It is bounded on the north by the Arambagh and Serampore subdivisions of the Hooghly district; on the east by the Barrackpore, Alipore and Diamond Harbour subdivisions of the 24-Parganas district; on the south by the Tamluk subdivision of Midnapore; and on the west by the Tamluk and Ghatal subdivisions of the latter district, and the Arambagh subdivision of the Hooghly district. The boundaries are partly natural and partly artificial. On the west and south-west the river Rupnarayan, and on the east and south-east the river Hooghly, constitute natural boundaries, while on the north the boundary is formed by the Bally khal and an artificial line marking the southern limit of the Hooghly district. Its extreme length from north to south is 39 miles, and its extreme width from east to west is 33 miles.

The area of the district, which is the smallest in Bengal, is 522 square miles, and its population, according to the latest census returns is 1,098,867, showing a density of 2,105 per square mile.

The headquarters of the district is at Howrah, situated on the right bank of the river Hooghly. This is also the chief town in respect of both population (224,873) and commercial importance.

The district is divided for administrative purposes into two subdivisions and fifteen thanas, the names and population of which are shown in Appendix I to this chapter.

The district is in charge of a Collector, who administers it with the help of the usual complement of officers and staff. This officer is also the District Magistrate. A portion of the administration relating to Local Education, Public Health, Buildings and Communications is under the control of a District Board, under which body there are two Local Boards, one in each subdivision. There are also two municipalities in the district managing the affairs of the municipal areas.

II—Physical features.

In shape the district is an irregular triangle, bounded on two sides by the great rivers Hooghly and Rupnarayan, the apex of which lies at their confluence near Fort Mornington. Hemmed in between the Hooghly on the east and the Rupnarayan on the west, and intersected by the Damodar, the Howrah district consists of a flat alluvial plain, with a gradual almost imperceptible fall to the south and south-east, the general flow of drainage being consequently in the same direction.

The whole area covered by the district is a result of the activities of these rivers and their branches, and, as may be expected, comprises two main divisions—(1) the raised river banks, and (2) the large marshes or lowlands which separate them.

Three distinct tracts may be recognised, each associated with one of the rivers mentioned above, with a depression in between, viz., an eastern tract stretching away to the west from the Hooghly and its branch, the Saraswati; a central tract lying on either side of the Damodar and its branch, the Kana Damodar; and a western tract, extending eastwards from the Rupnarayan.

In the area comprising the raised river banks are situated most of the villages, which are usually surrounded by a luxurious growth of bamboos, palms and fruit trees; while the lowlands from rich rice-fields, which stretch to the verge of the reed-bordered marshes which cover the lowest portions of the depressions between the rivers. The interior of the country is thus broken up into extensive swamps, which form vast sheets of water in the rains. In the area traversed by the Rajapur drainage channel the country is so low that for miles not a single house or tree is visible, the monotony of this extensive expanse of water being broken only by the banks of the drainage channel.

The portion of the district lying to the south of the Bengal-Nagpur Railway presents characteristics somewhat different from those already noticed. In this area the rivers become broader, the currents stronger due to tidal action, and the land more fluvial in character. The villages are spaced out at greater distances, and the country is protected from inundation by long embankments. Roads are few in number, and the chief means of communication are boats and paths along the embankments. Frequent breaches of the embankments occur when the rivers are in flood, and the water, finding its way through these and through numerous creeks, covers the whole country, giving the effect of an inland sea, from which the scattered villages stand out like islands.

III—River system and marshes.

The district is drained by three large rivers, of which the Hooghly and the Rupnarayan skirt it on the east and west, and the Damodar runs through it. These, together with numerous khals, which are either tributaries or off-shoots of the main streams and intersect the country in all directions, comprise the river system of the district, the entire system being subject to the influence of tidal action.

The principal rivers are :—

(1) Hooghly.

(2) Rupnarayan.

(3) Damodar.

(4) Saraswati and its continuation, the Sankrail khal.

(5) Kana Damodar and its continuation, the Sijbaria khal.

(6) Madaria khal.

(7) Bally khal.

A description of these rivers will be found in Appendix I to Chapter II in which the characteristics of the more important rivers in the province have been briefly described.

Owing to its configuration the district contains a large number of marshes, which cover the lowlying depressions formed between the raised strips marking the river channels. Three distinct groups of such marshes may be recognised; the first termed the Howrah swamps, lying between the raised banks of the Hooghly and the Saraswati, the second called the Rajapur swamps, between the Saraswati and the Kana Damodar, and the third, known as the Amta swamps, between the Kana Damodar and the Damodar. One of the chief problems of the district is to devise a proper system for draining these marshes, and the question has formed the subject of many drainage schemes dating as far back as 1870.

IV—Climate and rainfall.

The climate of the district is very similar to that of Calcutta, being hot and moist. During the summer months the heat, though great during the day, is alleviated in the afternoon by a southerly sea-breeze. Hail-storms sometimes occur. This period is fairly healthy and not particularly

unpleasant. The monsoon sets in by the middle of June and continues up to the middle of September. During this period the temperature is lower, but in September, owing to heavy rainfall and high humidity, the heat becomes oppressive. The climate in the cold weather is pleasantly cool and fairly bracing. The most unhealthy part of the year is the transition period between the rains and the cold weather, when, due to stagnant pools and decaying vegetation, malaria is rife and the general health is at its lowest.

The average annual temperature is 78·8°. The mean temperature in January is 66·5° and in April 85·6°. The average daily variation is limited within a range of 16·2°.

The normal annual rainfall is 60·9 inches, of which only about 4·1 inches fall during the months from November to April.

V—Floods and inundations.

The district being very little raised above mean sea level and being traversed by three large rivers, would, under natural conditions, be subject to very heavy flooding, but this is prevented to some extent by the presence of long embankments running along the banks of the rivers and helping to keep the flood waters from spreading over the land. Notwithstanding this, the whole area, except the strip in the east and south-east lining the banks of the Hooghly, is more or less submerged during high floods. The most destructive inundations occur when the rivers rise very high owing to excessive rain, and, being met by high tides, are unable to discharge their waters quickly.

The extent to which the district is subject to inundation is indicated on a sketch map (Plate X), areas usually inundated at intervals of from one to three years, those inundated at intervals of about five years, and those subject to occasional inundation being shown in different colours.

VI—Soils, crops and irrigation.

The whole district is covered with an alluvial soil, which varies from sand in the river beds to sticky mud in the interior, along the silted-up streams, and mud in the swamps. Clayey and heavy loamy soils prevail in the north, and lighter loams in the south, where the deposits are more recent. Several classes of soil are known: *bele*, or sandy soil; *entel*, or clayey soil; *penko*, or muddy soil; and *bhasa* or marshy soil.

Winter rice and jute are the staple crops. Other crops grown are sugarcane, autumn rice, maize, pulses and oilseeds. Market gardening of fruit and vegetables is also extensively undertaken with a view to meeting local demands and those of the adjoining city of Calcutta.

Artificial irrigation is practised, but not on an extensive scale, as the land being lowlying and rainfall abundant, it is not ordinarily required, except for certain special crops (sugarcane, potatoes, brinjals, betel-leaf and spring rice), the cultivation of which either takes place after the rains or is spread over several seasons. The water used for irrigation is obtained from rivers, khals and drainage canals, and also from jheels, tanks and, to a small extent, wells. In all cases it is raised by hand and allowed to gravitate on to the fields. There is no canal irrigation in the district.

VII—Industries, hats and melas.

The industrial activity of the district is concentrated in its north-eastern corner, being confined to the strip of country extending along the western bank of the Hooghly from Bally in the north to Uluberia in the south. Apart from this area the rest of the district is mainly agricultural, and shows very little signs of industrial activity on a large scale. The factory industries, which are represented by 210 factories, are almost entirely confined to the comparatively small area noticed above, the only exception being the existence of 10 rice mills at Shampur, situated in the south of the district on the western bank of the Damodar. The factories include cotton and

jute mills and presses, rice, oil and flour mills, ship-building and general engineering works, railway workshops, metal, paint and rope works, and several miscellaneous factories. The distribution of the factories, excluding the 10 rice mills mentioned above, is 125 within the limits of the City of Howrah, 29 in Bally, 26 in Malipanchgarah, 7 in Uluberia, 6 in Sankrail, 4 in Bowria, 2 in Jagacha and 1 in Domjur. The names given above refer to thana areas.

Of the non-factory industries silk-spinning and pottery-making are carried on fairly extensively on a small scale. Steel implements are also manufactured by hand in small quantities.

About 8·4 per cent. of the total population is solely engaged in industries.

As is the case in all districts of the province the sale of local produce and the purchase of every-day necessities take place at rural markets called "hâts," the duration of which is limited to a day or less, and at more pretentious fairs called "melas," which may extend into several days or even weeks. Hâts, which are usually held weekly, but may in the more thickly populated areas be held bi-weekly or even daily vary greatly in size, the attendance ranging from a modest gathering of 50 or so to as much as several thousands. Melas are periodic gatherings usually taking place annually, although in some cases two or three melas may be held during the year at the same place. Excluding those of minor importance there are 68 hâts and 12 melas in the district. The particulars of these are given in Appendix II to this chapter, and their locations are shown in the skeleton sketch map of the district (Plate X), each item being indicated by an index number which corresponds with the number assigned to the particular item in the list.

VIII—Waterways, steamer services and ferries.

The most important navigable waterways in the district are the rivers Hooghly, Damodar and Rupnarayan. Of these the Hooghly and Rupnarayan are navigable all the year round throughout their course in and along the district, while the Damodar ceases to be navigable after the rains, except in the lowest section from the mouth of the Gaighata khal to its own outfall into the Hooghly. During spring tides small boats can go up to Amta. Small boats also ply in the rains and winter months along the numerous khals intersecting the district. Of these khals the most important are the Bally, the Sankrail, the Kalsapa, the Mithkundu, the Pukuria, the Banspati, the Madaria, the Gaighata and the Bakshi. These are of varying lengths and depths, and are connected with one or other of the larger waterways. The Midnapore Locked Canal, reach VIII, though navigable has lost its importance since the construction of the Bengal-Nagpur Railway line from Calcutta to Kolaghat.

A large amount of traffic in passengers and goods is conveyed by small native boats along all the main waterways of the district, while on the Hooghly, the Rupnarayan and (in the rains) the Damodar heavier boats may be seen bringing down rice and other agricultural produce, and carrying up kerosine oil, etc.

Several steamer ferry services ply daily between Calcutta and places in this district. With the exception of one, all these services are run by Messrs. Hoare Miller and Co., the exception being the service between Bandarghat and Ahiritola (Nimtolla Ghat), which is run by the Ghatal Steam Navigation Company.

Excluding minor private ferries there are altogether 15 recognised public ferries in the district, all controlled by the District Board. Particulars of the more important of these are given in Appendix III to this chapter, and their locations are shown in the skeleton sketch map of the district (Plate X), each item being indicated by an index number which corresponds with the number assigned to the particular item in the list.

IX—Railways.

Railway communication within the district is provided by eight sections of railway with a total length of about 84·75 miles. The location of these railways is shown on the skeleton sketch map of the district (Plate X), and a few of the more important particulars relating to them are given in Appendix IV to this chapter. As will be seen from the map the entire eastern portion of the district, extending to the Damodar river on the west and the Bengal-Nagpur Railway line on the south, is well served by its railways, which run through all the important industrial centres, and are also so placed that most of the country is within easy reach of them. On the other hand, in the rest of the district, comprising in the north a strip on the west of the Damodar, and in the south the large tract between the rivers Hooghly and Rupnarayan, the railways do not serve the country to the same extent, there being only a single railway line, which cuts across the centre of the tract. The district contains approximately 16·23 miles of railway in respect of each 100 square miles of country.

X—Existing road system.

The road system at present in existence in the district comprises an approximate total length of 2,060 miles of metalled and unmetalled roads of all classes, for the upkeep of which several authorities are responsible. The mileage of the roads under each administrative authority in the district and the average annual expenditure incurred on their upkeep is given below. The figures shown have been obtained from the respective authorities, but must be taken as being only approximately correct, as in many cases the records and accounts are not kept in such a way as to make it possible to obtain accurate information under the separate heads into which the roads have been divided. They are, however, of sufficient accuracy to serve the purpose of the present report :—

Class.	Authority responsible for upkeep.	Metalled roads.			Unmetalled roads.		
		Mileage on 31st March 1937.	Total annual expenditure being the average for quinquennium ending 31st March 1937.	Average annual expenditure per mile.	Mileage on 31st March 1937.	Total annual expenditure being the average for quinquennium ending 31st March 1937.	Average annual expenditure per mile.

	Total ..	236	1,21,325		1,824	52,560	

Note.—(a) Details shown below :—

Serial number.	Name of road.	Average width.	Length of section.	Average annual expenditure.		Maintenance cost per square yard.
				For whole length.	Per mile.	
		Feet.	Mile.	Rs.	Rs.	Rs.
	I.—Bitumen or tar grouted.					
(a)	Grand Trunk Road—North ..	23·54	4·651	35,215	7,571	0·54
(b)	Grand Trunk Road—South ..	20·00	0·835	11,475	13,742	1·13
	Total ..		5·486			
	II.—Bitumen or tar painted.					
(a)	Grand Trunk Road—North ..	23·75	0·552	1,242	2,250	0·16
(b)	Grand Trunk Road—South ..	18·83	2·606	16,581	6,363	0·57
(c)	Foreshore Road	12·00	1·036	2,503	2,416	0·34
(d)	Orissa Trunk Road	9·00	3·000	6,764	2,235	0·43
	Total ..	..	7·194	..	..	..
	III.—Hard stone metal.					
(a)	Orissa Trunk Road	12·00	0·500	561	1,122	..
	IV.—Laterite.					
(a)	Orissa Trunk Road	8·00	11·156	12,506	1,121	..

(b) Includes—
(i) 16·00 miles of hard stone metal.
(ii) 5·00 miles of mooram or laterite, and
(iii) 49·37 miles of brick metal.

The first two of the classes listed above, viz., *Government* roads and *district* roads, form the main lines of communication in the district, and constitute the most important portion of the road system. A detailed list of the roads included under these two classes is given in Appendix V to this chapter, and the alignments followed by them are shown in the skeleton sketch map of the district (Plate X), each item being indicated by the same index number in both the map and the list so as to facilitate reference. In the case of the *district* roads these index numbers also correspond with the schedule numbers shown in the most recent approved schedule of roads issued under the authority of the District Board, in which will be found brief particulars showing crest width, metalled width, number and types of bridges, etc., of all district and subdivisional roads. This record being in existence and always available for reference, no attempt has been made to reproduce the information in the present report. The remaining three classes of roads, viz., *subdivisional*, *urban* and *village* roads, are of minor importance from the point of view of the present scheme and have therefore neither been listed nor shown on the map.

XI—Road investigations and traffic census.

An account of the investigations carried out with the object of studying the nature of the existing roads and bridges in the several districts of the province has already been given in Chapter V, which deals with this question for the province as a whole. As explained in the same chapter, details of the observations taken, although not included in the present report, have been placed on record in the office file. In this district the examination made and particulars recorded relate to 98 miles of road and 3,998 running feet of bridging, which includes 4 major bridges and 380 minor bridges and culverts. Particulars of the bridges on the existings railways in the district were also collected to help in the examination of the general drainage conditions and the study of the important question of obstruction to the

same caused by the construction of raised embankments. A classification according to length of opening has been made of the waterway of the bridges on the more important road and railway embankments existing in the district. This is shown in Appendix VI to this chapter.

A census of traffic was taken by actual count on some of the roads in the district selected as representative of the several classes into which the existing road system could be graded according to volume of traffic carried. Each traffic observation covered a period of seven consecutive days and nights. In most cases the observations were repeated at the same point at different times of the year, so as to indicate the extent to which the traffic varied. A complete record of the observations taken is given in Appendix VII to this chapter, and an examination of the results will be found in Chapter V, in which the general question of traffic statistics in the province as a whole is dealt with.

On account of the heavy cost involved the preparation of a record of traffic by actual count had to be restricted to only a few roads in the district. Steps were, however, taken to obtain a rough idea of the total traffic on each of the other important roads in the district, the method employed being to have these roads arranged approximately in relative order of traffic importance as compared with the roads on which actual observations had been taken. This was done by the District Engineer in consultation with his staff, these officers having a good knowledge of local conditions, and being in the best position to judge of the probable traffic intensities of the roads under their control. The results, including both the actual observations and the approximations mentioned above, are shown in graphical form in Appendix VIII to this chapter.

XII—Scheme for improved roads.

The general principles followed in selecting the alignments for the roads included in the improved road system in the several districts in the province have already been explained in Chapter VI, and need not be repeated here. In accordance with these principles, a complete scheme has been framed in the district for a road system which is considered sufficiently comprehensive to serve the needs of the district to a reasonable degree, in respect of both internal communication within the district itself, and of inter-district, provincial and inter-provincial communication.

The roads included in the complete district scheme are listed below, each item being assigned an index letter for use in referring to the item in other parts of the report:—

Index letter.	Location.		Approximate length in miles.	Classification.
	From—	To—		
A ..	Howrah ..	Bally ..	7	Provincial—Trunk.
B ..	Ditto ..	Baigachi ..	7	Ditto.
C ..	Baluhati ..	"Z" on item "K" below.	27	Ditto.
D ..	Howrah ..	Domjur ..	11	District—Main.
E ..	Bipra-Nawpara ..	Wadpur ..	4	Ditto.
F ..	Bauria ..	Debandi ..	14	Provincial—Trunk.
G ..	Amta ..	Sitapur ..	12	Inter-district—Main.
H ..	Ditto ..	Palaspai ..	8	Provincial—Trunk.
I ..	Bagnan ..	Kankrol ..	12	District—Main.
J ..	Uluberia ..	Raghudebpur ..	6	Ditto.
K ..	Ditto ..	Kulian ..	9	Ditto.
L ..	Bagnan ..	Shyampur ..	13	Ditto.
M ..	Sultanpur ..	Jhumjhumi ..	4	District—Secondary.
		Total ..	134	

A descriptive statement showing particulars of length, route, purpose served, cost, etc., of the items is given in Appendix IX to this chapter, and

the location of the roads is shown in the skeleton sketch map of the district (Plate X), the same index letters being used both in the statement and in the map in order to facilitate reference.

The figures given in the statement to show the approximate cost for the several items included in the scheme are based on rough estimates worked out after brief examination at site and collection of the necessary data. The type of investigations made, and the method employed for preparing the rough estimates, have been described in Chapter VIII, which deals with the question of the preparation of rough estimates for the whole province. As explained in the same chapter it must be clearly understood that the figures furnished in these estimates, although not based on haphazard guess work, cannot be taken as representing correctly the expenditure likely to be involved during actual construction, and cannot therefore be used for obtaining administrative approval.

A record of the observations made and the complete rough estimates for the items of the scheme are given in Appendix X to this chapter. It will be seen that two alternative rough estimates have been prepared for each item, the first in accordance with Specification "A," and the second in accordance with Specification "B". The details of these specifications, and the reasons which have led to the adoption of two alternative standard specifications, have been fully explained in Chapter VII, which deals with the general question of the adoption of standard specifications for the complete road scheme in the whole of the province.

The total length of improved roads proposed in the district is 134 miles, which includes 29 miles of existing metalled road, 35 miles of existing unmetalled road, and 70 miles of entirely new road, these figures being approximate, as the lengths are susceptible to change when the detailed alignments are actually set out. The total estimated cost of the district scheme (inclusive of bridging) stands at Rs. lakhs as per Specification "A" and Rs. lakhs as per Specification "B." The scheme provides 1 mile of road in respect of every 3·9 square miles of area, or in respect of every 8,200 heads of population in the district. On the assumption that a road, railway or steamer service is capable of tapping the country lying within 5 miles on either side of it, and neglecting obstructions which may be offered by unbridged rivers, the existing railways and steamer services and the proposed roads, when taken together, will serve 97·0 per cent. of the total area of the district, leaving untapped only 16 square miles of country, as indicated in the skeleton sketch map of the district (Plate X). The area directly served by the road system alone amounts to aproximately 506 square miles, representing 97·0 per cent. of the total area of the district.

The scheme provides for the connection by road of the district headquarters and the headquarters of the only outlying subdivision. Direct road connection has also been provided to 11 thana headquarters, while the headquarters of the 2 remaining thanas, although not directly connected, will be within 5 miles of an improved road, which will make it easy for a short connecting link to be added at a later stage.

XIII—Acceptance of district scheme for improved roads by district and other authorities.

A descriptive list of the roads included in the complete district scheme, together with a sketch map showing their positions, was sent to the authorities mentioned below for examination and expression of their opinion as to the suitability of the scheme from their respective points of view. The extent to which the scheme has been approved or objected to by the various authorities is given below:—

(1) District Board.—Approved scheme in full, conditionally on certain additional roads also being included. The case is still under reference.

(2) Collector.—Approves scheme in full and commends for consideration the request of the District Board for additional roads. The case is still under reference.

(3) Commissioner.—Approves scheme in full.

(4) East Indian Railway.—Approves scheme, but objects to the following item:—

(*i*) Item No. B—in respect of its entire length—Howrah to Baigachi.

(5) Bengal-Nagpur Railway.—Considers scheme unobjectionable.

(6) Howah-Amta and Howrah-Sheakhala Railways—Object strongly to item No. B—in respect of its entire length. Have expressed no opinion as to the other items.

The objections raised by these Railways and any alternative proposals suggested by them are dealt with separately in Chapter XXXVII.

In order to make the report self-contained in respect of the important question relating to acceptance of, or objection to, the scheme by the several authorities concerned, and to place on record such documents as may be required for reference in dealing with this question at a latter date, it has been considered desirable to attach copies of the correspondence on the subject with the various parties.

Copies of the correspondence with the Collector and the Chairman, District Board, which relate exclusively to this district, are given in Appendix XI to this chapter.

Copies of the correspondence with the Commissioner of the Burdwan Division, which relate to the six districts forming the Division, are given in Appendix IX to Chapter XXXVII.

Copies of the correspondence with the Railways, which relate to the entire area served by these lines, are given in Appendix IV to Chapter XXXVI.

In this district therefore unanimous acceptance by all parties concerned has been obtained in respect of all the items included in the scheme, except item No. B, the entire length of which is objected to.

XIV—Order of priority for construction.

The question of the order in which the roads selected to form the complete district scheme should be taken up for construction, has also been considered from the district point of view. The views of the Collector of the district and of the District Board on this subject were invited, and copies of the relevant correspondence are given in Appendix XI to this chapter. The order in which the district authorities place the items included in the scheme is shown below:—

Index letter.	Location.		Order of priority assigned by—	
	From—	To—	District Board.	Collector.
A ..	Howrah ..	Bally ..	I ..	The Collector agrees with the District Board.
B ..	Ditto ..	Baigachi ..	II ..	
C ..	Baluhati ..	"Z" on item "K" below.	III ..	
D ..	Howrah ..	Domjur ..	V ..	
E ..	Bipra-Nawpara ..	Wadpur ..	VII ..

APPENDICES TO CHAPTER XIII.

Appendix I.

Howrah.

List of subdivisions and thanas, showing area, population and density as per 1931 census.

Subdivisions and thanas.	Area.	Population.	Density per sq. mile.
1	2	3	4
	Sq. miles.	Number.	
I—Sadar subdivision	*174*	*570,693*	*3,280*
1. Howrah (including thanas Golabari, Sibpur, Bantra and Malipanchghara).	10	224,873	22,487
2. Sibpur (outside Howrah City) ..	..	232	..
3. Domjur	37	80,605	2,179
4. Jagacha	8	18,121	1,286
5. Sankrail	29	81,640	2,815
6. Jagatballavpur	38	45,558	1,199
7. Panchla	34	63,523	1,868
8. Bally	18	56,141	3,118
II—Uluberia subdivision	*348*	*528,174*	*1,517*
1. Amta	128	188,088	1,469
2. Bagnan	59	92,811	1,573
3. Uluberia	73	116,004	1,589
4. Bowria	5	25,621	5,124
5. Shampur	83	105,650	1,272

Appendix II.

Howrah.

Statement showing hâts and melas arranged roughly in order of importance.

PART I—HÂTS.

Index No. on map.	Name of hât.	Thana in which located.	When held.	Daily attendance.

Weight per foot width of metalled track	10·96

Total weight of all traffic in seven days—1,037·50 tons.

(1) Location of observation—Mile 2·25.

(2) Index No. and name of road—No. 27. Mugkalyan Road.

(3) Supervising officer—Babu S. K. Mookherjee, Overseer.

(4) Nature of road surface—Metalled.

(5) Full width and metalled width of road—12′0″ and 8′ 0″.

(6) Average weight in tons of all traffic in 24 hours—60·74 tons.

Motor traffic

		Tons.
Total weight in seven days	.. .. ..	54·75
Average weight per day of 24 hours	.. .. ..	7·82
Weight per foot width of road	.. .. ..	0·65

Non-motor traffic

		Tons.
Total weight in seven days	.. ..	527·40
Average weight per day of 24 hours	.. ..	75·34
Weight per foot width of road	.. ..	6·22

Total weight of all traffic in seven days—582·15 tons.

Appendix VIII.

Howrah.

Diagram showing average weight in tons of motor and non-motor traffic (per day of 24 hours) with figures for pedestrian traffic.

Serial No.	Index No.	Name. Road from—
1	1P	Grand Trunk Road.
2	1	Howrah to Jagatballavpur.
3	2	Old Benares Road.
4	10	Santragachi to Mohiary.
5	4	Narendrapur to Amta.
6	13	Mohiary to Kundu.
7	8	Makardah to Andul.
8	19	Mohiary to Rajganj.
9	14	Andul to Ekkabarpur.
10	5	Domjur to Bowria.
11	25	Ashutosh Road.

Serial No.	Index No.	Name. Road from—
12	3	Jagatballavpur to Amta.
13	31	Makardah to Ekshora.
14	46	Munshirhat to Ghorda.
15	15	Domjur to Kuldanga.
16	27	Bagnan to Mugkalyan.
17	58	Baragachi to Jalasi.
18	28	Bagnan to Fatehpur.
19	53	Nuniahat to Kamalpur.
20	55	Bowria to Basudebpur.
21	73	Sijberia to Panchla.
22	16	Uluberia to Kharuberia.
23	29	Bagnan to Mankar.

NOTE.—Roads carrying traffic of less than 31 tons per day of 24 hours have not been included in the graph.

Appendix IX.

Howrah.

Statement showing particulars of items included in the road system recommended for improvement.

Index No.	Classification.	Location. From—	Location. To—	Location. Route.	Purpose served.	Sub-sections. No.	Sub-sections. From—	Sub-sections. To—	Length in miles.	Rough cost in rupees. Specification "A."	Rough cost in rupees. Specification "B."
1	2	3	4	5	6	7	8	9	10	11	12
A ..	Provincial—Trunk	Howrah ..	Bally ..	Following Government road No. 1P	This is the section of the Grand Trunk road in the Howrah district and calls for no special remarks.	1	Howrah ..	Bally ..	7·00	2,50,000	..
B ..	Ditto ..	Ditto ..	Baigachi ..	Following District Board road No. 2	The road forms a section of the old Benares road along which route it is proposed to develop a bi-pass to the Grand Trunk road between Howrah and Memari.	1	Howrah ..	Baigachi ..	7·45	6,00,000	4,50,000
C ..	Ditto .. (Sub-sections 3 and 4 are District—Main).	Baigachi on item B above.	"Z" on item "K" below.	Following District Board road No. 6 to Domjur, District Board road No. 15 to Gangadharpur, new alignment from thence to Kulgachia railway station via Chak Sonthy-Ayma, Kumar Chak Jagrampur and Bangalpur; thence by new alignment to meet item "K" at "Z."	The road will form the main central line of communication running through the heart of the north-eastern and central portion of the district.	1 2 3 4 5	Baigachi .. Domjur .. Jujeswar. Chak Sonthy-Ayma. Kulgachia.	Domjur .. Jujeswar .. Chak Sonthy-Ayma. Kulgachia. "Z."	4·80 8·00	2,25,000 4,00,000	1,50,000 2,75,000
D ..	District—Main ..	Howrah ..	Domjur on item C above.	Following District Board roads Nos. 13 and 7.	The road will serve a very important area lying to the west of Howrah and will connect at Domjur with the central main road (item C).	1 2	Howrah .. Maurigram.	Maurigram .. Domjur.	..	..	..
E ..	Ditto ..	Bipra-Nawpara on item D above.	Wadpur on item C above.	Following District Board road No. 22.	The road will form a short link between item C and D.	1	Bipra-Nawpara ..	Wadpur ..	..	..	..
F ..	Provincial—Trunk (Sub-sections 1 and 2 are District—Main).	Bauria on west bank of Hooghly.	Debandi on item G below.	Following District Board road No. 5 to one mile beyond Panchla, thence by new alignment for about 5 miles to Maju railway station and thence by new alignment to Debandi.	The road will form a main line of communication running north through the centre of the eastern portion of the district.	1 2 3 4	Bauria .. Panchla .. Jujeswar .. Maju ..	Panchla .. Jujeswar .. Maju .. Debandi ..	.. .. 4·00 2·00	.. .. 2,00,000 1,25,000	.. .. 1,50,000 75,000
G ..	Inter-district—Main (Sub-section 1 is Provincial—Trunk).	Amta ..	Sitapur (Hooghly district boundary near Jagatballvpur railway station).	Following District Board road No. 3 to Jagatballavpur railway station and Local Board road No. 9 to boundary.	The road forms a branch to the main road—item F above, serving to tap a large area to the north-west of the Howrah-Amta Railway line.	1 2	Amta .. Debandi ..	Debandi .. Sitapur. ..	5·00 7·00	2,50,000 3,25,000	1,75,000 2,00,000

H ..	Provincial—Trunk	Amta ..	Palaspai (Hooghly district, boundary).	Following District Board road No. 26.	The road, together with item I below, will serve an area lying on the west of the Damodar which has practically no communication at present. It will act as a good feeder to the railway.	1 2	Amta .. Kankrol ..	Kankrol Palaspai.	} 8·00	9,00,000	7,50,000
I ..	District—Main ..	Bagan	Kankrol on item H above.	Following District Board road No. 29 for about 4 miles and thence by new alignment to Kankrol *via* Kalyanpur, Bholsari, Jhamtia and Joypur.	The road, together with item H above, will serve a large area on the west of the district. It will also act as a feeder to the railway at Bagnan.	1 2	Bagnan .. Kalyanpur	Kalyanpur .. Kankrol.	..	..	..
J ..	Ditto ..	Uluberia ..	Raghudebpur on item F above.	Following new alignment for about 2 miles and thence District Board road No. 73 to Raghudebpur.	The road together with portions of items C, D, E and F will form the through connection between Howrah and the subdivisional headquarters at Uluberia.	1	Uluberia ..	Raghudebpur ..	..	..	..
K ..	Ditto ..	Ditto ..	Kulian on item L below.	Following District Board road No. 41 for about 6 miles and thence by new alignment to Kulian.	The road will form the main artery leading towards the southern portion of the subdivision.	1 2	Uluberia .. "Z" ..	"Z" Kulian. ..	..	..	..
L ..	Ditto ..	Bagnan ..	Shyampur ..	Following District Board road No. 27 and a new alignment leading to Shyampur on the west bank of the Damodar river.	The road will provide a main line of communication in the strip of country lying between the Damodar and the Rupnarayan rivers in the south of the district.	1 2 3	Bagnan .. Kulian .. Sultanpur ..	Kulian .. Sultanpur. Shyampur.	..	..	..
M ..	District—Secondary	Sultanpur on item L above.	Jhumjhumi on east bank of the Rupnarayan opposite Tamluk.	Following new alignment for about 2 miles and thence District Board road No. 60 to the east bank of the Rupnarayan opposite Tamluk, a subdivisional headquarters of the Midnapore district.	The road forms a short western extension of item L affording a link with the road system in the Midnapore district. The Rupnarayan river will, however, remain unbridged.	1	Sultanpur ..	Jhumjhumi ..	..	..	..

Appendix X.

Howrah.

Rough estimates for the roads selected to form the scheme for improved roads in the district.

NOTE.—Estimates for the following roads have not been included in this appendix as they have either not been prepared or else, although prepared, were received too late for check :—

Road No. C—Sub-sections 3 to 5.

Road No. D—Sub-sections 1 and 2.

Road No. E—Sub-section 1.

Road No. F—Sub-sections 1 and 2.

Road No. I—Sub-sections 1 and 2.

Road No. J—Sub-section 1.

Road No. K—Sub-sections 1 and 2.

Road No. L—Sub-sections 1 to 3.

Road No. M—Sub-section 1.

ESTIMATE No. 1.

Road No. A—Sub-section 1—Howrah to Bally.

Reconstruction of Bally Khal Bridge.

	Rs.	Rs.
1. Land	65,000	
2. Approaches	57,970	
Total ..	1,22,970	
Say ..		1,23,000

(Taken from the Public Works Department file on the subject.)

Bridge—Length 180 r. ft. (in 3 spans).

Width=27 r. ft.

Footpaths=8′ 0″ wide each.

Cost of bridge and footpaths—

	Rs.	Rs.
3. Bridge=180′×27′=4,860 s. ft. At Rs. 17 per s. ft.	82,620	
4. Footpaths=2×180′×8′=2,880 s. ft. At Rs. 15 per s. ft.	43,200	
		1,25,820
Total ..		2,48,820
Say ..		2,50,000

ESTIMATE No. 2.

Road No. B—Sub-section 1—Howrah to Balgachi.

	Say ..	58,600		43,600

NOTE.—Land width for the first two miles within Howrah town will be less than for the rest of the road. The estimate for the land, therefore, stands as shewn below.

Estimate for land.

	Rs.
1st mile—Width required = 50 feet, existing width = 35 feet. Additional land required = 5,280′ × (50′ − 35′) = 79,200 s. ft. = 5·5 bighas. At Rs. 24,000 per bigha	1,32,000
2nd mile—Width required = 60 feet, existing width = 44 feet. Additional land required = 5,280′ × (60′ − 44′) = 84,480 s. ft. = 5·87 bighas. At Rs. 10,000 per bigha	58,700
3 to 7·45 miles—Width required = 100 feet, average existing width = 38 feet. Additional land required = 5,280′ × 5·45 × 38′ = 1,093,488 s. ft. = say 76 bighas. At Rs. 250 per bigha	19,000
Total cost of land for 7·45 miles	2,09,700
∴ Average cost per mile	28,148
Say	28,100

Part (4)—Rough estimate showing probable cost of the road including bridging.

Items.	Specification A. Quantity.	Rate.	Cost.	Specification B. Quantity.	Rate.	Cost.

Appendix XI

Howrah.

Copies of correspondence with the district authorities relating to (i) acceptance of district scheme, and (ii) order of priority for construction.

Copy of letter No. 3361-62 R. D., dated the 16th June 1937, from the Special Officer, Road Development Projects, Bengal, to the Collector of the district and Chairman of the District Board, Howrah (with extract of enclosures).

I have the honour to invite a reference to the discussion which took place at the meeting held at Howrah on the 21st May 1937, at which yourself, the Chairman of the District Board, the District Engineer and I were present. After some discussion a selection was made of those roads considered to be the most suitable for inclusion in the comprehensive scheme for road development in Bengal.

I attach a skeleton map of Western Bengal and a district map of Howrah on which the alignments of the selected roads in the Howrah district have been shown in red and green lines, the red lines indicating Provincial Trunk roads and green lines, roads of other classes, such as inter-district roads and district main and secondary roads. A list of the selected roads is also attached for reference and record.

It is now necessary to have the scheme approved by the District Board as a whole, and I request you to be so good as to have the scheme put up to and approved at the next meeting of the Board.

A formal intimation of the approval of the scheme both by yourself and by the District Board may kindly be sent to me as early as possible so as to enable me to include the proposals in my report on road development which is due for submission at an early date. The scheme may be considered item by item so that in case the scheme is not approved in its entirety, those items which are agreed to may be approved and the reasons for not accepting other items may please be stated.

In order to expedite the case, a copy of this letter is also being sent direct to the Chairman of the Board for necessary action.

It is requested that the roads, which have been selected as representing the items necessary to provide a complete road system for your district, be arranged in the order in which you consider they should be taken up for improvement. The order of priority may kindly be worked out in consultation with the District Board. It will strengthen the case to be presented to Government, in my report, if unanimous opinion can be obtained on this question. I hope you will agree that the construction of the Trunk roads should take precedence over that of other roads unless there are very strong reasons for advocating the construction of individual items of a lower class.

Memo. No. 3362 R.D., dated the 16th June 1937.

Copy, together with a skeleton map of the district and the list of roads, forwarded to the Chairman, District Board, Howrah, for information and for favour of necessary action. It is requested that the approval of the Board be communicated to the Collector at a very early date.

List of roads selected to provide an improved road system of the shortest length considered sufficient to efficiently serve the interests of the district and at the same time afford the most suitable connections with neighbouring districts and also with the rest of the province.

---

(2) Copy of letter No. 3648 G., dated the 9th August 1937, from the Collector, Howrah district, to the Special Officer, Road Development Projects, Bengal.

With reference to your letter No. 3361 R.D. of 16th June 1937, I have the honour to refer you to letter No. 2850 G. of 5th August 1937, from the District Board, Howrah, to my address, a copy of which has been sent to you direct by the District Board, and to say that I agree with the opinion of the District Board as regards your proposals and the order in which the roads should be taken up. I understand, however, from our conversation on the 21st May that we are not irrevocably bound to take up the purely district roads in this order and that latitude will be allowed from time to time as funds are allotted so that those roads which in the circumstances existing at the time seem most urgent to the inhabitants of this district may be taken up.

2. As regards the request of the District Board that certain other roads shall be included in the scheme, I commend this to your sympathetic consideration. I agree with all the proposals for extra roads except the two which would mean two extra bridges over the Damodar. If, however, the District Board will be content with ferries at these points there is less objection, though as regards the road from Uluberia to Syampore I should be inclined to say that a road running north-west and south-east to the Hooghly in continuation of C—25 would be better than a long road running almost parallel with your proposed road. I am also doubtful about the proposed road from Howrah to Mohiary and from Andul to Kulai as this is too close to the railway.

These additional proposals have not been framed in consultation with me, but I do not wish to hold up the main question by examining them in detail in consultation with the District Board especially as, for all I know, it may not be possible for you to include any more roads.

---

(3) Copy of memorandum No. 2851 G., dated the 5th August 1937, from the Chairman of the District Board, to the Special Officer, Road Development Projects, Bengal, forwarding a copy of his letter No. 2850 G., dated the 5th August 1937, addressed to the Collector (with extract of enclosure).

Copy together with a copy of the District Board resolution referred to in the letter and a copy of the skeleton map showing the alignment of the additional roads proposed for inclusion in the scheme is forwarded to the Special Officer, Road Development Projects, Bengal, in continuation of this office letter No. 2685, dated the 27th July 1937.

M. N. ROY,

Chairman.

Copy of letter No. 2850 G., dated the 5th August 1937, from the Chairman, District Board, Howrah, to the District Magistrate of the district.

I have the honour to invite a reference to your letter No. 3078 G., dated the 30th June last, and subsequent correspondence resting with this office memorandum No. 2687 G., dated the 27th July 1937, regarding the scheme of roads proposed in this district by the Special Officer, Road Development Projects, Bengal, in his letter No. 3361 R.D., dated the 16th June 1937, to your address and to inform you that the subject was considered by the Board at its Special Meeting held on the 31st July 1937, and it has unanimously approved the scheme framed by the Special Officer, Road Development Projects, Bengal, in its entirety. In addition to the roads included in the scheme framed by the Special Officer, the Board also recommended ten more roads for inclusion in the said scheme and for incorporation in the comprehensive scheme of road development projects in Bengal with a view to provide a complete road system throughout the district. A list with a description of these ten proposed additional roads together with a skeleton map showing their alignments is enclosed herewith for your information and necessary action.

A copy of the resolution of the Board on this subject is also enclosed herewith for your information.

A copy of this letter together with copies of enclosures has been forwarded separately to the Special Officer, Road Development Projects, Bengal.

List of additional roads recommended by the Board for inclusion in the scheme of roads prepared by the Special Officer, Road Development Projects, Bengal, for the district of Howrah.

Extract from the minutes of the proceedings of a Special Meeting of the Howrah District Board held on the 31st July 1937.

2. The letter No. 3361 R.D., dated the 16th June, 1937, from the Special Officer, Road Development Projects, Bengal, to the address of the Collector of Howrah, a copy of which was forwarded to the Chairman of the District Board for necessary action regarding the scheme for development of roads in the district of Howrah, was considered.

The Chairman read out the letter of the Special Officer to the address of the Collector, Howrah, and pointed out that conference was held at the Collector's bunglow on 21st May 1937 at which the Special Officer, the Collector, the District Engineer and himself were present. At that conference a general discussion was made regarding the road problem in this district, and the Special Officer forwarded thereafter with the aforesaid letter a comprehensive scheme for development of roads in this district containing thirteen projects together with a skeleton map showing the alignments of the selected roads. The Board was asked to examine the scheme and forward its opinion through the Collector of the district with a view to enable the Special Officer, Road Development Projects, Bengal, to include the proposals in his report on road development to the local Government. In the said letter it was also suggested that in case the Board did not agree to any particular project the reason therefor should also be stated by it. The Board should also consider the order of priority in which the roads should be taken up for improvement. A copy of the aforesaid letter together with a copy of the skeleton map and a copy of the statement showing the roads proposed was also forwarded to each member of the Board for information. The Chairman also pointed out that no selection was made at the aforesaid conference at the Collector's bunglow.

After a general discussion it was unanimously decided that the scheme of roads as proposed in this district, by the Special Officer for inclusion in the comprehensive scheme for road development in Bengal should be approved by the Board in its entirety, but in view of the fact that in the scheme prepared by the Special Officer no road was proposed in certain important localities of the district, and with a view to provide a complete road system throughout the district the following ten roads which were considered to be important and necessary should also be recommended for inclusion in the said scheme:—

(1) Dehibhuirsuit to Khoriop.

(2) Manasri to Munshirhat.

(3) Amta to Paikhala.

(4) Uluberia to Shibpur.

(5) Makardah to Kulai.

(6) Howrah to Mohiary.

(7) Andul to Rajgunj.

(8) Bipronapara to Makardah.

(9) Jagadishpur to Bally.

(10) Ichanagori to Domjur.

Resolution No. 877.

That the scheme of roads forwarded by the Special Officer, Road Development Projects, Bengal, with his letter No. 3361 R.D., dated the 16th June 1937, to the address of the Collector, Howrah, be approved in its entirety, and that ten more roads, the names of which have been noted above and the alignments and importance of which have been shown in the enclosed statement, be also recommended to the Special Officer for inclusion in the scheme of roads prepared by him for this district and for incorporation of the same in the comprehensive scheme for road development in Bengal.

Resolved further that the roads including the additional roads recommended by the Board be taken up in the order of priority noted below:—

	Name of roads.	Classification.	Reference on map.
1.	Howrah-Bally	Inter-Provincial —Trunk ..	A
2.	Howrah-Baigachi	Ditto	B
3.	Baluhati-Z on route K in the skeleton map.	District —Main	C
4.	Amta-Paikhala	Ditto	P
5.	Bagnan-Shyampur	Ditto	L
6.	Howrah-Domjur	Ditto	D
7.	Amta-Palaspai	Ditto	H
8.	Bipronapara-Wadpur	Ditto	E
9.	Bauria-Debandi	Ditto	F
10.	Amta-Sitapur	Ditto	G
11.	Bagnan-Kankrol	Ditto	I
12.	Uluberia-Raghudebpur	Ditto	J
13.	Uluberia-Kulian	Ditto	K
14.	Sultanpur-Jhumjhumi	Ditto	M
15.	Dehibhuirsuit-Khoriop	Ditto	N
16.	Manasri-Munshirhat	Ditto	O
17.	Uluberia-Shibpur	Ditto	Q
18.	Makardah-Kulai	Ditto	R
19.	Howrah-Mohiary	Ditto	S
20.	Andul-Rajganj	Ditto	T
21.	Bipronapara-Makardah	Ditto	U
22.	Jagadishpur-Bally	Ditto	V
23.	Ichanagori-Domjur	Ditto	W

Resolved further that the rough estimates for all these above-noted roads be prepared by the District Engineer at an early date for submission to the Special Officer, Road Development Projects, Bengal, as desired by him, and that the Chairman be authorised to appoint a suitable man having requisite engineering qualification for a period of one month at present for the purpose of preparation of the estimates for the aforesaid roads.

True copy.

Illegible,

Head Clerk, District Board, Howrah.

---

(4) Copy of letter Nos. 3640-41 R.D., dated the 8th September 1937, from the Special Officer, Road Development Projects, to the Collector of the district and Chairman of the District Board.

With reference to your letter No. 3648 G., dated the 9th August 1937, in connection with the above, I have the honour to note that you agree with the opinion of the District Board expressed in their resolution No. 877 in which they approve of the proposed road scheme in its entirety. I agree with you that so far as the district roads are concerned, latitude ought to be allowed to change the order now given, so that should circumstances have changed by the time actual construction taken in hand, the question of urgency can be reconsidered.

2. It is noted that the District Board have resolved that ten new items should be added to those forming the road scheme. While offering no criticism at this stage of the additional items put forward, I should like to point out that the system proposed by me (without including these additional roads) already provides for one mile of improved road in respect of 4·08 square miles of the area covered by the district, which is greater than that provided in most other districts in the province. Similar figures, for the districts in the Burdwan Division, are 1 mile of road for 4·69 square miles in the Hooghly district, 5·72 square miles in the Birbhum district, 6·68 square miles in the Burdwan district, 7·07 square miles in the Bankura district and 8·86 square miles in the Midnapore district. This will indicate that your district has already been given a very fair share of roads. As Government are pressing for the early termination of the road investigation and submission of the final report, it is not possible at this stage to investigate the additional items proposed by the District Board, but mention will be made in my report of these additional items, so that your views and those of the District Board in this respect can be considered by Government after issue of the final report.

Memo. No. 3641 R.D., dated the 8th September, 1937.

Copy forwarded to the Chairman of the District Board, Howrah, for information, with reference to his memorandum No. 2851 G., dated the 5th August 1937.

(5) Copy of letter No. 3795 G., dated the 18th September 1937, from the Chairman of the District Board, to the Special Officer, Road Development Projects, Bengal

With reference to your memorandum No. 3641 R.D., dated the 8th September 1937, forwarding a copy of your letter No. 3640 R.D., of even date, to the address of the Collector of Howrah, regarding the complete system of trunk and subsidiary roads in this district, I have the honour to state that this Board accepted the scheme forwarded by you in its entirety on the assumption that due consideration would be made about the additional proposals made by this Board. If the detailed investigation reported and other necessary data are not forwarded by you to Government in respect of the additional proposals made by this Board on the ground that a larger proportion of roads has been allotted to this district as compared to the proportion in the other district in this division, the Board should be given an opportunity to reconsider the matter with a view to determine what roads should be recommended by it within the limit of proportion of roads allowed by you in respect of this district.

A temporary Overseer of your department was appointed by this Board to prepare the required data in respect of the roads suggested by you and also of those additional roads which the Board recommended for inclusion in the scheme. Necessary data have been collected in the meantime in respect of most of the roads suggested by you and those for the remaining ones including the additional projects will also be prepared by him soon. It is expected that a comprehensive report dealing with the importance of each additional road together with the requisite data in respect thereof will be ready for submission to you by the middle of October next.

So instead of simply mentioning these additional roads in your report, those roads may also be considered and recommended by you and the report together with the data in respect of the additional roads may also be forwarded by you to Government.

If this is not considered feasible, the Board should be given an opportunity to reconsider the matter with a view to determine which roads within the prescribed limit (viz., 1 mile of road for 4·03 square miles of area) should be recommended by it for this district for inclusion in the road development programme.

---

(6) Copy of letter No. 3689 R.D., dated the 25th September 1937, from the Special Officer, Road Development Projects, Bengal, to the Chairman, District Board, Howrah.

With reference to your letter No. 3795 G., dated the 18th September 1937, in connection with the above, I have the honour to note that as now pointed out by you, the previous acceptance by the District Board of the comprehensive road scheme formulated by me and forwarded through the Collector with my No. 3361 R.D., dated the 16th June 1937, as intimated to you in my memorandum No. 3362 R.D., of the same date, is to be considered, conditional on the provision of the ten extra roads which the Boards recommended for inclusion in the scheme.

I also note that you are having investigations made for these ten roads as well as those already proposed by me and that I am to expect by the middle of October next a complete report on the whole scheme.

The present position is that as my report has to be sumbitted not later than the end of October next, all further examination of proposal for additional roads has had to be stopped, so as to permit of the whole of the energy of myself and my staff being employed in the writing up of the report. It will not therefore be possible for me to personally examine the new proposals in sufficient detail to make out a revised scheme which will entirely supersede the scheme already framed. If however, a scheme of this nature can be prepared by your District Engineer, in consultation with yourself and the Collector, I shall be very pleased to incorporate the same in my report with such remarks as I can offer in the absence of the detailed personal examination of the same.

In this connection I would suggest that possibly the best solution of the problem would be for yourself and your District Engineer to meet me at my office, 6, Government Place, North (Top floor), Calcutta, so that we can have a preliminary discussion on the subject and may perhaps thereby be able to introduce suitable modifications in the scheme which while satisfying the needs of the district from your point of view, will at the same time be unobjectionable from my point of view in which the question of avoiding road rail competition will be the main factor. I suggest that you fix up a date for the meeting over the phone, my phone No. being Regent 740.

---

(7) Copy of letter No. 4167 G., dated the 6th October 1937, from the Chairman, District Board, to the Special Officer, Road Development Projects, Bengal.

With reference to your letter No. 3689 R.D., dated the 25th September 1937, regarding the comprehensive road scheme in the Howrah district, I have the honour to request that the proposal made by this Board for additional roads in this district may very kindly be examined. The District Board and myself have very carefully considered the question of communication throughout the area of this district and the additional roads proposed by this Board for inclusion within the road development scheme were found to be in the best interests of this district.

Myself and the District Board have again considered the matter and we have earnestly to request you that in examining the additional schemes, preference be given to the following roads in the order mentioned below :—

(1) Dehibhuirsuit to Khoriop.

(2) Amta to Paikhala.

(3) Jagadishpur to Bally.

(4) Uluberia to Shibpur.

These roads are extremely important for the purpose of communication in this district.

I may add that Mr. Symons, the District Magistrate, is now on leave. I do not know whether it will be necessary for me to come to your office. The District Engineer will see you to-morrow. I shall leave town for a change on the 8th instant after evening and I shall not be back before the 5th of November 1937. I shall, however, come back for a day or two on the 27th October 1937.

The complete report with regard to the roads in your scheme and the additional roads proposed by this Board (the major portion of which report has already been despatched to you) will be furnished to you by the middle of this month as already promised by me.

CHAPTER XIV.

Midnapore.

I—Situation, boundaries, area, population and administration.

Midnapore, the third largest district in the province, is the southernmost district of the Burdwan Division. It is situated between 21° 36′ and 22° 57′ north latitude, and between 86° 33′ and 88° 11′ east longitude. It is bounded on the north by the district of Bankura; on the east by the river Hooghly and its tributary, the Rupnarayan, which separates the district from the 24-Parganas, Howrah and Hooghly; on the south by the coast line of the Bay of Bengal. On the west the boundary marches with the Balasore district and the Mayurbhanj State in Orissa, and with the Singhbhum and Manbhum districts of Chota Nagpur. Its extreme length from north-west to south-east is 115 miles, and its extreme width from north-east to south-west is 75 miles.

The area of the district is 5,245 square miles, and its population, according to the latest census returns, is 2,799,093, showing a density of 534 per square mile.

The headquarters of the district is at Midnapore, situted on the northern bank of the Cossye river. Midnapore, with a population of 32,021, is also the chief town of the district in respect of commercial importance, but Kharagpur, at which the main workshops of the Bengal-Nagpur Railway are located, has a larger population (58,134).

The district is divided for administrative purposes into 5 subdivisions and 33 thanas, the names, areas and population of which are shown in Appendix I to this chapter.

The district is in charge of a Collector, who administers it with the help of the usual complement of officers and staff. This officer is also the District Magistrate. A portion of the administration relating to Local Education, Public Health, Buildings and Communications is under the control of a District Board, under which body there are five Local Boards, one in each subdivision. There are also seven municipalities in the district managing the affairs of the municipal areas.

II—Physical features.

In shape the district resembles a rectangle resting on a base formed by the Hooghly estuary and the Bay of Bengal on the south-east, with the rivers Darakeswar and Rupnarayan more or less outlining an adjacent side on the north-east.

Owing to its geographical position Midnapore is one of the most varied, as regards physical aspects, of the districts of Bengal. In the north and north-west the country forms a part of the eastern fringe of the Chota Nagpur plateau, and consists of a hard laterite formation. In the east and south-east lies an alluvial plain formed by deposits carried down by rivers forming a part of the great Gangetic system of Upper India. This portion has characteristics very similar to those of the districts of lower Bengal. The south and south-west forms a maritime tract, subject to tidal waves and to the inroads of the sea, with characteristics similar to those of Orissa.

The general appearance of the district is that of a large open and well-cultivated plain, but towards the north and west gentle undulations appear with ridges covered by a thick growth of dwarf sal trees and other scrub

jungle, while in the extreme north-west there are several hills over 1,000 feet in height. The remainder of the country is an almost level plain, broken only by the sandhills which line the sea coast and stretch for some miles inland.

Broadly speaking, two natural divisions with very distinct characteristics may be recognised, the Bengal-Nagpur Railway, running north and south from Midnapore, generally forming the dividing line between them. To the east of this line the soil is purely alluvial, the country is flat, and the land is fertile and fully cultivated. To the west the country is undulating, with a surface of alternating ridges and depressions, and consists of long rolling waves of laterite rock, forming the termination of the highlands of Central India. The soil on the ridges is poor and not generally cultivated, but in the intervening depressions the soil, which is composed of the richer and finer particles washed down from the slopes above, is fertile and produces rich crops of rice.

The alluvial portion may again be subdivided into three divisions. The first is a lowlying strip of purely deltaic country bordering the Rupnarayan and the Hooghly, and extending for about 20 miles inland from these rivers. This tract is intersected by numerous rivers and interconnected watercourses, which are subject to tidal influence, and has a character similar to the neighbouring districts of Hooghly, Howrah and the 24-Parganas. Beyond the inner edge of this strip the character of the surface changes, in that while still being an alluvial deposit with no signs on the surface of the laterite formation below, the tidal influence diminishes, the watersheds of the streams become more marked, and the general elevation of the country is higher.

The second division consists of the littoral tract which lies at the head of the Bay of Bengal, and is exposed to the full force of the south winds which are prevalent during several months of the year. Most of the tract is open to the incursions of the sea, and has to be protected by a long embankment. Much of the soil in this area is saline. A remarkable feature is the presence of a range of sandhills, about 60 feet in height, extending along the coast line at an average distance of 6 miles from it, between the Rasulpur river on the east and the Subarnarekha on the west. It is probable that this range was at one time the coast line; and a similar formation appears to be now going on along the present coast line, where a sand ridge is gradually being raised by the action of the strong south wind during the hot months of the year. Generally the tract between the sandhills and the sea has a sandy soil, on which cocoanuts, betel-palms and melons flourish.

The third division consists of the alluvial tract constituting the remainder of the eastern half of the district. This is a monotonous rice plain intersected by numerous waterways and tidal creeks, which are lined with embankments to protect the fields from flood water. Much of the area is water-logged, and this is particularly the case with the portion lying between the Selai and the Cossye rivers, which is a lowlying depression formed by the combined deltas of these rivers and intersected by numerous khals. The river beds having risen above the level of the adjoining land, the latter has to be protected from inundation by a complicated system of embankments, many of which unfortunately obstruct the natural drainage of the country and cause water-logging.

III—River system and marshes.

The general direction of flow of the rivers in the district is from the highland on the north-west, towards the rivers Rupnarayan and Hooghly in the south-east. The largest streams which traverse the district enter it either from the Bankura district or from the district of Singbhum in Bihar, and flow across the western elevated area in fairly well-defined channels and with rapid currents. As these streams progress eastwards through the flat and lowlying alluvial area forming the eastern part of

the district, they lose their velocities, begin to wind in tortuous courses, and to inundate the surrounding country. In their lower reaches these rivers are tidal and have raised their beds to such an extent that their waters have to be confined by embankments to keep them from spreading over the country. The district is also intersected by a large number of small streams which rise within the district itself and form tributaries to the main rivers. These have features depending more or less upon the nature of the country traversed.

The principal rivers are—

(1) Hooghly.	(5) Subarnarekha.
(2) Rupnarayan.	(6) Haldi.
(3) Selai.	(7) Kaliaghai.
(4) Cossye.	(8) Rasulpur.

A description of these rivers will be found in Appendix I to Chapter II, in which the characteristics of the more important rivers in the province have been briefly described.

The elevated undulating area forming the western half of the district contains no marshes to speak of, but in the eastern portion of the district larger areas of the country are covered by water during the rains, and form expansive rice swamps. After the rains are over and the level of the rivers falls, the greater portion of the water drains off, leaving inundated patches covering the lowest lying depressions dotted over the country. Many of these dry up during the hot months, but some retain water throughout the year. The most extensive of these depressions is that formed by a water-logged tract in the north-east of the district, bounded by the Selai river on the north and the Cossye on the south.

IV—Climate and rainfall.

The climate of the southern and eastern portions of the district differs from that of the northern and western. In the latter it is very similar to that of Bankura, being much hotter and drier than in the former, the climate of which resembles that of the 24-Parganas. In both tracts the monsoon generally sets in by the middle of June and continues up to the middle of September. During this period the temparature and humidity are somewhat less than that during the summer months, when the heat is great, characterised, especially in the northern and western parts, by low humidity. The cold weather is short, but has a pleasant and bracing climate while it lasts.

The average annual temperature is 80·1°. The mean temperature in December is 67·4° and in April 88·2°. The average daily variation is limited within a range of 19·2°.

The normal annual rainfall in 60·1 inches, of which only about 5·35 inches fall during the months of November to April.

V.—Floods and inundations.

The western half of the district being well raised is not subject to extensive inundation by flood; the land adjoining the rivers Subarnarekha, Cossye and Selai is submerged to a varying extent during very high floods, but only for short periods. In the eastern half of the district, where the country flattens and the rivers begin to lose their velocity, large areas are subject to inundation; in the north the thanas of Chandrakona, Ghatal, Kespur and Daspur, and in the south the thanas of Pingla, Sabang, Narayangarh, Pataspur and Contai are the areas most affected.

The extent to which the district is subject to inundation is indicated on a sketch map (Plate XI), areas usually inundated at intervals of from one to three years, those inundated at intervals of about five years, and those subject to occasional inundation being shown in different colours.

VI—Soils, crops and irrigation.

Three types of soil are found in the alluvial tract, viz., *entel*, a clayey soil, *doash*, a loamy soil, and *beledoash*, a sandy loam. In the laterite tract the soils are mostly loam and sandy loam, being reddish-brown in colour and generally less fertile than the corresponding types in the alluvial tract.

Aman or winter rice is the staple crop of the district. Other crops grown are autumn and summer rice, sugarcane, Indian-corn, cereals and pulses, jute, til, wheat, rape, mustard and other oilseeds and tobacco.

Artificial irrigation is extensively used in the district. The canal system is represented by the Midnapore High Level Canal, which takes off from the Cossye river above the anicut across this stream just below the town of Midnapore, and runs eastwards to Uluberia on the river Hooghly in the Howrah district, crossing the rivers Rupnarayan and Damodar on its way. Only the upper portion of this canal, extending from the head-works down to the west bank of the river Rupnarayan, is used as an irrigation canal, the rest of the length being used solely for navigation. The area irrigated by this system is about 190 square miles of country. The other system of irrigation found in the district is the tank system by which the fields are irrigated from small storage reservoirs or tanks in which water is collected during the rains. Two types of irrigation tanks are found, the first, in the eastern deltaic area, being low level tanks excavated below the surface of the ground, and the second, in the western elevated undulating area, being high level reservoirs formed by throwing embankments across the drainage slopes and depressions of the country, so as to pond up rain water. In the case of the low level tanks the water has to be raised by hand into elevated channels before it can be led on to the fields.

VII—Industries, hats and melas.

The chief industrial centre in the district is at Kharagpur, where the extensive workshops of the Bengal-Nagpur Railway are located. These works, which include seven different branches of railway engineering, cover an area of no less than 77 acres, and are surrounded by a populous town and the usual markets, shops and bazars which have sprung into existence to meet the needs of the residents, most of whom are railway employees. In addition to the railway works three other factories are to be found, viz., Messrs. W. and T. Avery's workshop, a tanning extract factory, and a rice-mill.

The rest of the district is mainly agricultural, the only factory industry being rice-milling. There are 41 rice-mills in this area, of which 9 are at Kolaghat, 6 at Ballichak, 5 at Salboni, 4 each at Madpur and Midnapore, 3 at Manikpara, 2 each at Sagarbarh and Bansdapalasi, and 1 each at Panskura, Jhargram, Belda, Etamogra, Gidni and Chandrakona Road Station.

Of the non-factory industries, silk and tusser-weaving, cotton-weaving, mat-making, and the manufacture of brass and bellmetal wares are the most important. Other industries are the manufacture of molasses and earthen pots and salt manufacture, the latter being a Government monopoly.

Only 2·2 per cent. of the total population is solely engaged in industries.

As is the case in all districts of the province, the sale of local produce and the purchase of every-day necessities take place at rural markets called "hats", the duration of which is limited to a day or less, and at more pretentious fairs called "melas", which may extend into several days or even weeks. Hats, which are usually held weekly, but may in the more thickly populated areas be held bi-weekly or even daily, vary greatly in size, the

attendance ranging from a modest gathering of 50 or so to as much as several thousands. Melas are periodic gatherings usually taking place annually, although in some cases two or three melas may be held during the year at the same place. Excluding those of minor importance there are 374 hats and 144 melas in the district. The particulars of these are given in Appendix II to this chapter, and their locations are shown in the skeleton sketch map of the district (Plate XI), each item being indicated by an index number which corresponds with the number assigned to the particular item in the list.

VIII—Waterways, steamer services and ferries.

The rivers Hooghly and Rupnarayan, which flow along the eastern boundary of the district, are important in so far as the waterways intersecting the district itself find an outlet into these rivers, which in themselves are navigable all the year round by boats and river steamers.

There are three navigable canals in the district, namely, the Midnapore High Level Canal, the Hijli Tidal Canal, and the Orissa Coast Canal. The Midnapore Canal runs from opposite Midnapore on the Cossye river to Dainan on the Rupnarayan, a distance of 36 miles. The Hijli Tidal Canal and the Orissa Coast Canal run in a continuous line, connecting the Hooghly and the Subarnarekha rivers. Both these canals are navigable and provide boat traffic between Calcutta and Orissa. Traffic on all these canals has decreased since the opening of the railway along the east coast.

Of the other waterways the Selai is navigable throughout the year for a short distance in its lower reaches, which are within tidal influence; the Haldi is navigable throughout the year, but is difficult at low tides owing to sandbars. It is moreover a treacherous river subject to tidal bores, and at all times noted for its swift strong current. The Cossye is navigable in the rains by large boats from its mouth to Panskura, but in the dry weather boats can only ply for a few miles above its confluence with the Haldi. The river Rasulpur, which has several feeders, also furnishes a large area with water communication in the interior.

There is a daily steamer service from Calcutta via Geonkhali and Tamluk to Kola (where the railway crosses the Rupnarayan). A thrice daily service is run between Kolaghat and Ghatal, but this is only possible when there is a sufficient depth of water above Ranichak. These services are maintained by the Calcutta Steam Navigation Company. Country boats ply in the Bay of Bengal, the Hooghly, and other tidal rivers of the district.

Excluding minor private ferries there are altogether 26 recognised public ferries in the district, all controlled by the District Board. Particulars of the more important of these are given in Appendix III to this chapter, and their locations are shown in the skeleton sketch map of the district (Plate XI), each item being indicated by an index number which corresponds with the number assigned to the particular item in the list.

IX—Railways.

Railway communication within the district is provided by four sections of railway with a total length of about 156.5 miles. The location of these railways is shown on the skeleton sketch map of the district (Plate XI), and a few of the more important particulars relating to them are given in Appendix IV to this chapter. As will be seen from the map, the district is quartered by its railways, one line running through the centre of the district from north to south and the other from east to west, thus dividing it into four sectors. In consideration of the small mileage of railway compared with its size the district may not at first sight appear to be well served by its railways, but actually the alignments of these lines are so

well placed that almost the entire area is tapped to a reasonable extent, the traffic being brought to the railways by several cross-roads running into the country. The part least served is the lowlying country forming the south-eastern sector. The district contains approximately 3 miles of railway in respect of each 100 square miles of country.

X—Existing road system.

The road system at present in existence in the district comprises an approximate total length of 2,618 miles of metalled and unmetalled roads of all classes, for the upkeep of which several authorities are responsible. The mileage of the roads under each administrative authority in the district and the average annual expenditure incurred on their upkeep are given below. The figures shown have been obtained from the respective authorities, but must be taken as being only approximately correct, as in many cases the records and accounts are not kept in such a way as to make it possible to obtain accurate information under the separate heads into which the roads have been divided. They are, however, of sufficient accuracy to serve the purpose of the present report:—

Class.	Authority responsible for upkeep.	Metalled roads.			Unmetalled roads.		
		Mileage on 31st March 1937.	Total annual expenditure, being the average for quinquennium ending 31st March 1937.	Average annual expenditure per mile.	Mileage on 31st March 1937.	Total annual expenditure, being the average for quinquennium ending 31st March 1937.	Average annual expenditure per mile.
1	2	3	4	5	6	7	8
		Miles.	Rs.	Rs.	Miles.	Rs.	Rs.
I	*Government roads* maintained by the Communications and Works Department.	(a) 111	74,036	666	Nil	..	..
II	*District roads* maintained directly by the District Board.	(b) 454	About 1,90,000	About 400	About 419	About 60,000	About 37
III	*Subdivisional Roads* maintained by Local Boards working under the control of the District Board.	(c) 19	..	..	1,214	Not available.	..
IV	*Urban roads* maintained by municipalities.	62	Incomplete.	..	50	Incomplete.	..
V	*Village roads* maintained by Union Boards.	4	600	140	285	2,586	9
	Total ..	650	2,64,636	..	1,968	62,586	..

(*a*) Includes (*i*) 4·00 miles of hard stone metal and (*ii*) 107·16 miles of mooram or laterite.

(*b*) Includes (*i*) 2·65 miles of bitumen or tar paint, (*ii*) 378·6 miles of mooram or laterite, and (*iii*) 73·63 miles of brick metal.

(c) Laterite.

The first two of the classes listed above, viz., *Government* roads and *District* roads, form the main lines of communication in the district, and constitute the most important portion of the road system. A detailed list of the roads included under these two classes is given in Appendix V to this chapter, and the alignments followed by them are shown in the skeleton sketch map of the district (Plate XI), each item being indicated by the

same index number in both the map and the list so as to facilitate reference. In the case of the *District* roads these index numbers also correspond with the schedule of roads issued under the authority of the District Board, in which will be found brief particulars showing crest width, metalled width, number and types of bridges, etc., of all district and subdivisional roads. This record being in existence and always available for reference, no attempt has been made to reproduce the information in the present report. The remaining three classes of roads, viz., *Subdivisional, Urban* and *Village* roads, are of minor importance from the point of view of the present scheme and have, therefore, neither been listed nor shown on the map.

XI—Road investigation and traffic census.

An account of the investigations carried out with the object of studying the nature of the existing roads and bridges in the several districts of the province has already been given in Chapter V, which deals with this question for the province as a whole. As explained in the same chapter, details of the observations taken, although not included in the present report, have been placed on record in the office file. In this district the examination made and particulars recorded relate to 182 miles of road and 19,739 running feet of bridging, which includes 7 major bridges and 1,002 minor bridges and culverts. Particulars of the bridges on the existing railways in the district were also collected to help in the examination of the general drainage conditions and the study of the important question of obstruction to the same caused by the construction of raised embankments. A classification according to length of opening has been made of the waterway of the bridges on the more important road and railway embankments existing in the district. This is shown in Appendix VI to this chapter.

A census of traffic was taken by actual count on some of the roads in the district selected as representative of the several classes into which the existing road system could be graded according to volume of traffic carried. Each traffic observation covered a period of seven consecutive days and nights. In most cases the observations were repeated at the same point at different times of the year, so as to indicate the extent to which the traffic varied. A complete record of the observations taken is given in Appendix VII to this chapter, and an examination of the results will be found in Chapter V, in which the general question of traffic statistics in the province as a whole is dealt with.

On account of the heavy cost involved the preparation of a record of traffic by actual count had to be restricted to only a few roads in the district. Steps were, however, taken to obtain a rough idea of the total traffic on each of the other important roads in the district, the method employed being to have these roads arranged approximately in relative order of traffic importance as compared with the roads on which actual observations had been taken. This was done by the District Engineer in consultation with his staff, these officers having a good knowledge of local conditions, and being in the best position to judge of the probable traffic intensities on the roads under their control. The results, including both the actual observations and the approximations mentioned above, are shown in graphical form in Appendix VIII to this chapter.

XII—Scheme for improved roads.

The general principles followed in selecting the alignments for the roads included in the improved road system in the several districts in the province have already been explained in Chapter VI, and need not be repeated here. In accordance with these principles, a complete scheme has

been framed in the district for a road system which is considered sufficiently comprehensive to serve the needs of the district to a reasonable degree, in respect of both internal communication within the district itself, and of inter-district, provincial and inter-provincial communication.

The roads included in the complete district scheme are listed below, each item being assigned an index letter for use in referring to the item in other parts of the report:—

Index letter.	Location.		Approximate length in miles.	Classification.
	From—	To—		
A ..	Harihar ..	Dhumsai ..	82	Provincial—Trunk.
B ..	Midnapore ..	Jamdahara ..	37	Inter-district—Main.
C ..	Khajurabheri ..	Dhankia ..	66	District—Main.
D ..	Silda ..	Mandaldiha ..	6	Ditto.
E ..	Abardihi ..	Kantapahari ..	12	District—Secondary.
F ..	Goaltore ..	Ghatal ..	42	District—Main.
G ..	Chandrakona ..	Garhbeta ..	9	District—Seondary.
H	Ghatal ..	Khadal-Gobra ..	97	District—Main.
I ..	Kuturia ..	Kalmijor ..	30	Ditto.
J ..	Lodhasuli ..	Kherikamathani ..	32	District—Secondary.
K ..	Tentulia ..	Gopiballavpur ..	6	Ditto.
L ..	Kesiari ..	Biramput ..	50	District—Main.
M ..	Debra ..	Paharichak ..	35	Ditto.
N ..	Kausalya ..	Bhamua ..	28	Ditto.
O ..	Saridaspur ..	Ghurbari ..	15	Ditto.
P ..	Bargoda-Gudar ..	Sutahata ..	21	District—Secondary.
Q ..	Lakshya ..	Suklalpur ..	3	Ditto.
R ..	Atmaramchak ..	Alichak ..	16	Ditto.
S ..	Baincha ..	Matiberua ..	20	Ditto.
		Total ..	607	

A descriptive statement showing particulars of length, route, purpose served, cost, etc., of the items is given in Appendix IX to this chapter, and the location of the roads is shown in the skeleton sketch map of the district (Plate XI), the same index letters being used both in the statement and in the map in order to facilitate reference.

The figures given in the statement to show the approximate cost for the several items included in the scheme are based on rough estimates worked out after brief examination at site and collection of the necessary data. The type of investigations made, and the method employed for preparing the rough estimates, have been described in Chapter VIII, which deals with the question of the preparation of rough estimates for the whole province. As explained in the same chapter, it must be clearly understood that the figures furnished in these estimates, although not based on haphazard guesswork, cannot be taken as representing correctly the expenditure likely to be involved during actual construction, and cannot, therefore, be used for obtaining administrative approval.

A record of the observations made and the complete rough estimates for the items of the scheme are given in Appendix X to this chapter. It will be seen that two alternative rough estimates have been prepared for each item, the first in accordance with Specification "A", and the second in accordance with Specification "B". The details of these specifications, and the reasons which have led to the adoption of two alternative standard specifications, have been fully explained in Chapter VII, which deals with the general question of the adoption of standard specifications for the complete road scheme in the whole province. The total length of improved roads proposed in the district is 607 miles, which includes 275 miles of existing metalled road, 220 miles of existing unmetalled road, and 112 miles of entirely new road, these figures being approximate, as the lengths are susceptible to change when the detailed alignments are actually set out.

The total estimated cost of the district scheme (inclusive of bridging) stands at Rs. lakhs as per Specification "A" and Rs. lakhs as per Specification "B". The scheme provides 1 mile of road in respect of every 8·6 square miles of area, or in respect of every 4,611 heads of population in the district. On the assumption that a road, railway or steamer service is capable of tapping the country lying within 5 miles on either side of it, and neglecting obstructions which may be offered by unbridged rivers, the existing railways and steamer services and the proposed roads, when taken together, will serve 92·9 per cent. of the total area of the district, leaving untapped only 369 square miles of country, as indicated in the skeleton sketch map of the district (Plate XI). The area directly served by the road system alone amounts to approximately 4,537 square miles, representing 88·4 per cent. of the total area of the district.

The scheme provides for the connection by road of the district headquarters and the headquarters of all subdivisions. Direct road connection has also been provided to 25 thana headquarters, while 4 thana headquarters, although not directly connected, will be within 5 miles of an improved road, which will make it easy for a short connecting link to be added at a later stage. It has not been found possible to provide an improved road within 5 miles of the remaining thana headquarters (4 in number) in the district.

XIII—Acceptance of district scheme for improved roads by district and other authorities.

A descriptive list of the roads included in the complete district scheme, together with a sketch map showing their positions, was sent to the authorities mentioned below for examination and expression of their opinion as to the suitability of the scheme from their respective points of view. The extent to which the scheme has been approved or objected to by the various authorities is given below :—

(1) District Board—Approves scheme in full.

(2) Collector—Approves scheme in full.

(3) Commissioner—Approves scheme in full.

(4) Bengal-Nagpur Railway—Considers scheme unobjectionable.

In order to make the report self-contained in respect of the important question relating to acceptance of the scheme by the several authorities concerned, and to place on record such documents as may be required for reference in dealing with this question at a later date, it has been considered desirable to attach copies of the correspondence on the subject with the various parties.

Copies of the correspondence with the Collector and the Chairman, District Board, which relate exclusively to this district, are given in Appendix XI to this chapter.

Copies of the correspondence with the Commissioner of the Burdwan Division, which relate to the six districts forming the division, are given in Appendix IX to Chapter XXXVII.

Copies of the correspondence with the Railway, which relates to the entire area served by this line, are given in Appendix IV to Chapter XXXVI.

In this district, therefore, unanimous acceptance by all parties concerned has been obtained in respect of the entire scheme.

XIV—Order of priority for construction.

The question of the order in which the roads selected to form the complete district scheme should be taken up for construction, has also been considered from the district point of view. The views of the Collector of the district and of the District Board on this subject were invited, and copies of the relevant correspondence are given in Appendix XI to this chapter. The order in which the district authorities place the items included in the scheme is shown below:—

Index letter.	Location.		Order of priority assigned by—	
	From—	To—	District Board.	Collector.
A ..	Harihar ..	Dhumsai ..	I ..	The Collector agrees with the District Board.
B ..	Midnapore	Jamdahara ..	VIII ..	
C ..	Khajurabheri ..	Dhankia ..	VII ..	
D ..	Silda ..	Mandaldiha ..	XX ..	
E ..	Abardihi ..	Kantapahari ..	XVII ..	
F ..	Goaltore ..	Ghatal ..	XVI ..	
G ..	Chandrakona ..	Garhbeta ..	XVIII	
H ..	Ghatal ..	Khadal-Gobra ..	II, IV and IX(*a*).	
I ..	Kuturia ..	Kalmijor ..	IV and XIII (*b*).	
J ..	Lodhasuli ..	Kherikamthani ..	XII and XIX(*c*).	
K ..	Tentulia ..	Gopiballapur ..	XII ..	
L ..	Kesiari ..	Biramput ..	XV ..	
M ..	Debra ..	Paharichak ..	VI and XIV(*d*).	
N ..	Kausalya ..	Bhamua ..	V ..	
O ..	Saridaspur ..	Ghurbari ..	VI ..	
P ..	Bargoda-Gudar ..	Sutahata ..	II and III(*e*).	
Q ..	Lakshya ..	Suklalpur ..	II ..	
R ..	Atmaramchak ..	Alichak ..	XI ..	
S ..	Baincha ..	Matiberua ..	X ..	

(*a*) The District Board divides the road into 3 sections, viz., (*i*) Basdebpur-Khadal Gobra, (*ii*) Ghatal-Kalmijor and (*iii*) Kalmijor-Panskura, the order of priority for which is as shown in the table; the section Panskura-Basdebpur is already metalled.

(*b*) The District Board divides the road into 2 sections, viz., (*i*) Keshpur-Kalmijor and (*ii*) Kuturia-Keshpur, the order of priority for which is as shown in the table.

(*c*) The District Board divides the road into 2 sections, viz., (*i*) Lodhasuli-Tentulia and Tentulia-Karikamathani, the order of priority for which is as shown in the table.

(*d*) The District Board divides the road into 2 sections, viz., (*i*) Paharichak-Saridaspur and (*ii*) Debra-Saridaspur, the order of priority for which is as shown in the table.

(*e*) The District Board divides the road into 3 sections, viz., (*i*) Basdebpur-Lakshia, (*ii*) Basdebpur-Bargudar and (*iii*) Lakshia-Sutahata. The order of priority given to the first of these is II, and that given to the remaining two sections combined is III.

APPENDICES TO CHAPTER XIV.

Appendix I.

Midnapore.

List of subdivisions and thanas, showing area, population and density as per 1931 census.

Subdivisions and thanas.	Area.	Population.	Density per square mile.
	Square miles.	Number.

Appendix VII.

Traffic Census in Midnapore district.

(1) Location of observation—Mile 25·75 (Panskura).
(2) Index No. and name of road—No. 1P. Orissa Trunk Road.
(3) Supervising officer—Babu Abhoy Charan Mookherjee, Overseer.
(4) Nature of road surface—Laterite stone-metalled.
(5) Full width and metalled width of road—24′ 0″ and 8′ 0″.
(6) Average weight in tons of all traffic in 24 hours—83·33 tons.

Day—6 a.m. to 6 p.m. Night—6 p.m. to 6 a.m.

Appendix IX.

Midnapore.

Statement showing particulars of items included in the road system recommended for improvement.

Index No.	Classification.	Location. From—	Location. To—	Location. Route.	Purpose served.	Sub-sections. No.	Sub-sections. From—	Sub-sections. To—	Length in miles.	Rough cost in rupees. Specification "A".	Rough cost in rupees. Specification "B".
1	2	3	4	5	6		8	9	10	11	12
A	Provincial—Trunk	Harihar (Hooghly district boundary).	Dhumsai (Orissa boundary).	Following District Board road No. 5 to Midnapore, Government road No. 1P to Khargpur, District Board road No. 36 to Kesiari, new alignment for about 8 miles to Nayagram and thence by District Board road No. 48 to the Orissa boundary near Dhumsai.	The road will form the main artery running through the district from north to south and will be continued on the north through the Hooghly and Burdwan districts to meet the Grand Trunk road at Burdwan, on the south there is at present no actual connection with the road system in Orissa, but the provision of a short length of road will link it up with the existing metalled road running from Baripada to Amarda R. S.	1	Harihar ..	Kesurgeria ..	15·50	15,25 000	12,50,000

						7	Nayagram ..	Dhumsai ..	15·00	4,00,000	2,75,000
B	Inter-district—Main	Midnapore on item A above.	Jamdahara (Bankura district boundary).	Following District Board road No. 4 and Government road No. 2P to Kuturia, District Board road No. 22 to Abradihi, District Board road No. 23 to Goaltore and new alignment to Jamdahara.	This road will provide the main inter-district connection with the Bankura district and is intended to take the place of the present Government road No. 2P, which runs parallel to the railway.	1	Midnapore ..	Abradihi ..	14·00	5,00,000	2,75,000
						2	Abradihi ..	Goaltore ..	11·00	5.00,000	3,25,000
						3	Goaltore ..	Jamdahara ..	12·00	6,00,000	4,00,000
C	District—Main ..	Khajurabheri on item A above.	Dhenkia (Bankura district boundary).	Following new alignment to Lodhasuli, District Board road No. 14 to Jhargram, District Board roads Nos. 14 and 16 to Silda, District Board roads No. 17 and 18 and a new alignment to the Bankura district boundary near Dhenkia.	This road will serve an extensive strip of the district lying to the south of the Cossye river, will act as a feeder to the Bengal-Nagpur Railway and will connect up with the road system in the Singhbhum district of Bihar.	1	Khajurabheri ..	Lodhasuli ..	..	..	..

						6	Bamni ..	Dhenkia ..	..	..	..
D	Ditto ..	Silda on item C above.	Mandaldiha (near Bankura district boundary).	Following District Board road No. 68	This road will continue in the Bankura district to Raipur and will form an extension of one of the main roads in Bankura serving to connect it with item C.	1	Silda ..	Mandaldiha ..	..	..	..
E	District—Secondary	Abradihi on item B above.	Kantapahari near Bankura district boundary.	Following District Board road No. 22	This road will serve an important area in the north-west of the district.	1	Abradihi ..	Kantapahari ..	..	..	..

F	District—Main (sub-sections 3 and 4 are provincial Trunk).	Goaltore on item B above.	Ghatal and on to Hooghly district boundary.	Following District Board road No. 7 up to Ghatal and new alignment from thence to district boundary.	The road will be the main east-west line of communication in the north of the district and will serve as a good feeder to the railway.	1	Goaltore ..	Chandrakona ..	..	..	..
						2	Chandrakona ..	Hematpur ..	..	..	..
						3	Hematpur ..	Ghatal ..	9·50	11,50,000	9,25,000
						4	Ghatal ..	Hooghly district boundary (Kagnan).	3·00	10,25,000	9,50,000
G	District—Secondary	Chandrakona Road Station on item F above.	Garhbeta ..	Following existing Government road No. 2P.	This short length of road is intended to connect the Garhbeta thana with the main road passing through Chandrakona Road Station.	1	Chandrakona Road Station.	Garhbeta ..	..	..	..
H	District—Main ..	Ghatal on item F above.	Khadal-Gobra (Digha) on south coast.	Following District Board road No. 31 to Daspur, District Board road No. 31 for about 2 miles, new alignment to Panskura, District Board road No. 11 to Tamluk, District Board road No. 38 to Contai, District Board road No. 44 to Ramnagar and District Board road No. 75 to the sea coast near Digha.	The road will run more or less from north to south through the entire length of the eastern portion of the district opening up a vast expanse of country at present most inaccessible.	1	Ghatal ..	Kalmijor ..	8·00	5,25,000	4,00,000
						2	Kalmijor ..	Panskura ..	12·00	6,75,000	5,00,000
						3	Panskura ..	Tamluk ..	..	..	..
						4	Tamluk ..	Basdebpur ..	..	..	..
						5	Basdebpur ..	Ghurbari .. }	18·00	13,75,000	10,25,000
						6	Ghurbari ..	Atmaramchak .. }			
						7	Atmaramchak ..	Contai ..	14·00	10,00,000	7,25,000
						8	Contai ..	Ramnagar .. }	20·00	12,25,000	7,75,000
						9	Ramnagar ..	Khadalgobra .. }			
I	Ditto ..	Kuturia on item B above.	Kalmijor on item H above.	Following Government road No. 2P to Godapiasal, District Board road No. 34 and new alignment to Keshpur, District Board road No. 26, new alignment for about one mile and District Board road No. 27 to meet item "H" above at Kalmijor.	The road forms an important cross road tapping a large area on the north of river Cossye and serving as feeder to the railway.	1	Kuturia ..	Keshpur ..	..	..	..
						2	Keshpur ..	Kalmijor ..	18·00	9,25,000	6,25,000
J	District—Secondary	Lodhasuli on item C above.	Kherikamathani on item A above.	Following District Board roads Nos. 15 and 49 with a short length of new alignment on the south of Subarnarekha.	The road is intended to serve the south-west corner of the district, the Subarnarekha which is crossed by the road will be left unbridged.	1	Lodhasuli ..	Tentulia ..	..	..	..
						2	Tentulia ..	Narda ..	..	..	..
						3	Narda ..	Kherikamathani ..	..	..	..
K	Ditto ..	Tetulia on item J above.	Gopiballavpur ..	Following District Board road No. 49 with a short length of new alignment.	The road forms a short branch to item J leading to the headquarters of the Gopiballabhpur thana.	1	Tentulia ..	Gopiballabhpur ..	..	..	..
L	District—Main ..	Kesiari on item A above.	Biramput on south coast.	Following District Board road No. 61 to Belda, District Board road No. 12 to Contai and District Board road No. 47 to the sea coast.	The road will form a main line of communication running across the south of the district and connecting the subdivisional headquarters at Contai with the Trunk road passing through Kesiari.	1	Kesiari ..	Contai Road ..	..	..	..
						2	Contai Road ..	Paharichak ..	..	..	..
						3	Paharichak ..	Egra ..	..	..	..
						4	Egra ..	Contai ..	..	..	..
						5	Contai ..	Biramput ..	..	..	..
M	Ditto ..	Debra ..	Paharichak on item L above.	Following District Board road No. 37 to Sabang, about 7 miles of new alignment and District Board road No. 46 to Patashpur and new alignment to meet L near Paharichak.	The road will form a main north-south line of communication running through the heart of the south-eastern portion of the district and tapping a large area at present ill supplied with road communication.	1	Debra ..	Gourangchak ..	..	..	..
						2	Gourangchak ..	Saridaspur ..	..	..	..
						3	Saridaspur ..	Paharichak ..	..	..	..
N	Ditto ..	Kausalya on item A above.	Bhamua ..	Following existing Government road No. 1P to Benapur and new alignment thence to Bhamua.	The road is intended to serve an extensive area lying to the south of the railway and to form a link in the road system serving to connect the south-eastern portion of the district with the headquarters at Midnapore.	1	Kausalya ..	Benapur ..	4·00	1,25,000	75,000
						2	Benapur ..	Gourangchak ..	12·00	5,00,000	3,25,000
						3	Gourangchak ..	Bhamua ..	10·00	5,00,000	3,25,000

O	District—Main ..	Saridaspur on item M above.	Ghurbari on item H above.	Following District Board road No. 46 with a short intermediate length of new alignment.	The road forms a short link between items H and M serving the intermediate territory.	1	Saridaspur ..	Ghurbari ..	..	..	..
P	District—Secondary	Bargoda-Gudar ..	Sutahata ..	Following District Board road No. 39, new alignment for about 5 miles, District Board No. 40 to Mahisadal, District Board road No. 41 and new alignment to Sutahata.	The road runs across item H and taps area lying on both sides of the main road.	1	Bargoda-Gudar ..	Basdebpur ..	..	..	..
						2	Basdebpur ..	Lakshya ..	8·00	3,50,000	2,25,000
						3	Lakshya ..	Sutahata. ..	..	..	..
Q	Ditto ..	Lakshya on item P above.	Suklalpur on south bank of Hooghly.	Following an entirely new alignment	The road forms a short branch to item P, terminating on the south bank of the river Hooghly facing Hooghly point in the 24-Parganas.	1	Lakshya ..	Suklalpur ..	5·00	2,25,000	1,50,000
R	Ditto ..	Atmaramchak on item H above.	Alichak on west bank of Hooghly.	Following new alignment to west of Khajuri and thence by District Board road No. 43 to Alichak.	The road forms a branch to the main road item H and taps a fairly large area in the south-east of the district.	1	Atmaramchak ..	Khajuri ..	..	..	..
						2	Khajuri ..	Alichak ..	..	..	..
S	Ditto ..	Baincha on item L above.	Matiberna at Orissa boundary.	Following District Board road No. 45	The road is intended to serve the area lying to the south-west of the main road (item L) connecting with the latter on the east and by means of a short length of road in Orissa with the Bengal-Nagpur Railway at Jaleswar on the west.	1	Baincha ..	Mohanpur ..	..	..	..
						2	Mohanpur ..	Matiberna ..	..	..	..

Appendix X.

Midnapore.

Rough estimates for the roads selected to form the scheme for improved roads in the district.

NOTE.—Estimates for the following roads have not been included in this appendix as they have either not been prepared or else, although prepared, were received too late for check :—

Road No. C—Sub-sections 1 to 6.

Road No. D—Sub-section 1.

Road No. E—Sub-section 1.

Road No. F—Sub-sections 1 and 2.

Road No. G—Sub-section 1.

Road No. H—Sub-sections 3 and 4.

Road No. I—Sub-section 1.

Road No. J—Sub-sections 1 to 3.

Road No. K—Sub-section 1.

Road No. L—Sub-sections 1 to 5.

Road No. M—Sub-sections 1 to 3.

Road No. O—Sub-section 1.

Road No. P—Sub-sections 1 and 3.

Road No. R—Sub-sections 1 and 2.

Road No. S—Sub-sections 1 and 2.

ESTIMATE No. 1.

Road No. A—Sub-section 1—Kesurgeria to Harihar.

6	5	Nil				
Total—3 miles excluding mileages having no bridges and culverts.					61	or 20·3 r.ft. per mile.

Allowance of 25 r.ft. per mile excluding bridges of over 100 ft. in length is considered necessary.

Extra provision for R. C. pipe culverts and minor bridges of length up to 30 ft. = 6 × (25′ − 20·3′) = 28·2 r.ft.

∴ R. C. pipe culverts = ¼ × 28·2 = 7·0, say	8	
Minor bridges up to 30 ft. = ¾ × 28·2 = 21·1, say ..	20	
Total ..	89	r.ft.

Abstract of the above.

Constructing minor bridges of length up to 30 s.ft. ..	65	
Constructing reinforced concrete pipe culverts	24	
Total ..	89	r.ft.

Midnapore—Estimate No. 5—*contd.*

Part (2) (b)—Details of existing bridges and proposals for improvement as per specification B.

2. With reference to paragraphs 2, 4 and 5 of the resolution of the District Board, I have the honour to state as follows.

Paragraph 2.—The views of the Board regarding the alternative alignment to the Grand Trunk Road have been noted.

Paragraph 4.—The inclusion in the scheme of a road running more or less directly between Boinchee and Kalna would mean the provision of an extra length of road of about 13 miles along an alignment not more than 6 miles away from other roads selected for improvement. My scheme does not provide for the location of parallel roads at such close intervals. Further, this proposal linking the two branches of the railways as it does will serve to short circuit the railway and is therefore objectionable. Therefore, while admitting the usefulness of the proposal, I regret my inability to include it in my recommendations.

Paragraph 5.—I quite agree with the proposal that a roadway may be provided along the Anderson weir at Rondia with a connection to the Grand Trunk road on the north and to item K of the Bankura road scheme on the south, which item connects Rangametia and Sonamukhi in the Bankura district. This is being entered in my map and list for inclusion in my report and a supplementary descriptive list in respect of this item, which has been designated item Q, is attached for incorporation in the list previously supplied.

A copy of this letter is being forwarded direct to the Chairman of the District Board for information.

Memo. No. 3558 R.D., dated the 11th August 1937.

Copy together with list forwarded to the Chairman, District Board, Burdwan, for information.

CHAPTER XII.

Hooghly.

I—Situation, boundaries, area, population and administration.

The district of Hooghly forms part of the Burdwan Division. It is situated between 22°36′ and 23°14′ north latitude, and between 87°30′ and 88°30′ east longitude. It is bounded on the north by the district of Burdwan; on the east by the river Hooghly, which separates it from the the district of Nadia and 24-Parganas; on the south by the districts of Howrah and Midnapore; and on the west by the districts of Midnapore, Bankura and Burdwan. Except for short distances the boundaries on three sides are artificial; that on the east (the river Hooghly) is natural. Its extreme length from north-east to south-west is 63 miles, and its extreme width from north-west to south-east is 35 miles.

The area of the district is 1,188 square miles, and its population, according to the latest census returns, is 1,114,255, showing a density of 938 per square mile.

The headquarters of the district is at Hooghly-Chinsura which is situated on the right bank of the river Hooghly. This is also the chief town in respect of both population (32,634) and commercial importance.

The district is divided for administrative purposes into three subdivisions and eighteen thanas, the names, areas and population of which are shown in Appendix I to this chapter.

The district is in charge of a Collector, who administers it with the help of the usual complement of officers and staff. This officer is also the District Magistrate. A portion of the administration relating to Local Education, Public Health, Building and Communications is under the control of a District Board, under which body there are three Local Boards, one in each subdivision. There are also six municipalities in the district managing the affairs of the municipal areas.

II—Physical features.

The district resembles a butterfly in shape, the right wing, comprising the area on the east of the Damodar, being considerably larger than the left.

The eastern portion of the district, lying between the Hooghly and Darakeswar, forms a flat alluvial plain, intersected by a number of sluggish rivers and streams. Although in general appearance this tract appears to be perfectly flat, there is in reality a gradual slope from north and west to south and east, and the courses of the rivers, streams and drainage channels follow this direction. The river banks are high and the sites of villages are raised. The small triangular area in the west, lying beyond the river Darakeswar, presents the appearance of a slightly undulating plain, covered with a soil of alluvium mixed with debris of laterite. Here the slope is more pronounced. In the extreme west the country becomes distinctly rocky, and forms a continuation of the uplands of Bishnupur.

Thus, for practical purposes, the district may be regarded as containing two main divisions—a small area in the west, comprising the uplands, and a larger area in the east, forming the plains, the river Darakeswar being the dividing line.

In the western area the country is drained by a number of small streams running into the Darakeswar. These streams display the usual characteristics of hill streams—sandy beds, rapid currents and a tendency to sudden rise and fall during the rains. In the cold weather they are usually dry. This area is characterised by a paucity of swamps and lowlying rice-fields, and the presence of patches of scrub jungle here and there.

The eastern area includes two distinct tracts, the first is a tract of lowlying land stretching between the rivers Damodar and Darakeswar The beds of these rivers and their connected streams are being gradually raised by annual deposits of silt and sand, and are already generally higher than the country which they surround or traverse. The land in this tract, although being slowly raised, is still more or less subject to constant flood, unless protected by embankments, and consequently cultivation is precarious. The smaller streams add to this uncertainty, as they also come down in flood and frequently change their courses, interlacing with one another in the most unexpected way. This uncertainty is further aggravated by the nature of the deposit—if silt, excellent rabi crops are raised; if sand, the land becomes sterile. Owing to the floods, the submersion of the country, and the constant changing in the courses of the smaller streams, the construction and upkeep of good roads within this tract is rendered difficult and expensive.

In the second tract, lying between the Hooghly and the Damodar, the country is somewhat higher, and due to this, and to the fact that the Damodar is confined by an unbroken embankment running along its eastern bank, the land is not ordinarily subject to flood, and crops are fairly secure. This area can broadly be divided into two sections, the high riparian strips of land along the banks of the rivers, and the saucer-shaped depressions between them. The former are for the most part taken up by village sites or used for growing vegetables and other suitable crops. The depressions are turned into extensive rice-fields, or if lower in level, form long marshes. A special feature of this tract is that most of the numerous small streams draining the area have more or less silted up and have no visible outfall, so that there is no current once the rains cease. The streams then become a succession of stagnant pools, while the land, being undrained (except by percolation), becomes water-logged.

III—River system and marshes.

The district is mainly the product of its rivers, and is still watered and drained by them. There are three large rivers, viz., Hooghly, Damodar and Darakeswar (which in its lower reaches becomes the Rupnarayan), and a large number of small streams, which are either the offshoots or the tributaries of the larger. The deltaforming activities of the Hooghly have in recent times been restricted to the formation of islands or banks on the sides or in the middle of its bed, and in some few places to the deposition of silt over comparatively small areas of the district, which are inundated by its waters during high flood. On the other hand, the Damodar and the Darakeswar still display great land-forming activities, and, where not restrained by artificial embankments, inundate large areas of country, gradually raising the level of the surface by silt deposition.

In addition to the rivers proper, both large and small, there are a considerable number of minor drainage channels which interlace with the rivers and with one another, and help to carry off water from the low land. These, however, are now gradually silting up.

The principal rivers are:—

(1) Hooghly.
(2) Damodar.
(3) Darakeswar.
(4) Kana Damodar.
(5) Madaria khal.
(6) Kana Darakeswar.
(7) Bally khal.
(8) Saraswati.
(9) Gangan or Behula.
(10) Kunti or Kana Nadi.
(11) Besia khal.
(12) Mundeswari.
(13) Amodar.
(14) Tarajuli.

A description of these rivers will be found in Appendix I to Chapter II, in which the characteristics of the more important rivers in the province have been briefly described.

There are no lakes in the district, but a number of large catchment basins are found in which water accumulates during the rains, forming long narrow stretches of water. Towards the close of the rains the lower lands are converted into swamps suitable for the cultivation of winter rice; and the lowest lands lying between the raised banks of rivers become jhils or extensive swamps. These jhils are partly drained by rivulets, but generally contain water even in the dry months. The greatest number of marshes is found in the thanas of Pandua and Polba in the Hooghly subdivision, Chanditala and Krishnagar in the Serampore subdivision, and Khanakul in the Arambagh subdivision. The most extensive marshes are the Khanyan marsh in thana Pandua, the Ghia Kana Nadi marsh, the Dankuni marsh in thana Chanditala, and the Damodar khal-Kana Darakeswar marsh in thana Khanakul.

IV—Climate and rainfall.

The climate of the district is hot and moist. The temperature during the summer months is high and increases steadily till the end of May. The heat is however somewhat relieved in the afternoons by a fairly cool breeze. Hailstorms are frequent in March and April, and the weather is generally cyclonic towards the end of the rains. The climate in the cold weather is pleasantly cool.

The climate of the area west of the Darakeswar is however somewhat different, being drier and very similar to that of the Bankura district which adjoins it.

The normal annual rainfall is 57·2 inches, of which about 5·23 inches fall during the months from November to April.

V—Floods and inundations.

The portion of the district lying to the west of the Darakeswar is not subject to extensive inundation by flood. The narrow strip of country lining the west bank of this river is however occasionally inundated during high floods. The central portion of the district lying between the Darakeswar and the Damodar is subject to very severe flooding, which on occasions has been known to submerge almost the entire area. The eastern portion of the district between the Damodar and Bhagirathi is lowlying, and under natural conditions would be subject to very extensive inundation, but due to a long protective embankment running along the eastern bank of the Damodar, and the road and railway embankments running along the western bank of the Bhagirathi, the flood waters of these rivers are shut out from the area, which is thus only affected by flooding caused by the local rainfall. All lowlying depressions become shallow lakes after heavy rainfall, and, due to defective drainage, the water stands on the land for long periods.

The extent to which the district is subject to inundation is indicated on a sketch map of the district (Plate IX), areas usually inundated at intervals of from one to three years, and those subject to occasional inundation, being shown in different colours.

VI—Soils, crops and irrigation.

The soil (except in thana Goghat) consists entirely of new alluvium, the deposit (5 to 10 feet thick) resting on a sub-soil of tenacious clay varying in thickness from 10 to 30 feet. The surface alluvium, where formed from the silt deposits of the Hooghly and the Saraswati, is of tough clay (*entel*), but that formed from the silt of the Damodar and its branches is light and porous. At Magra and in thana Arambagh the Damodar has deposited

a layer of sand on the subsoil. In the swamps (which receive the drainage of the villages) the bottom is usually of sticky tough clay. In the north of the district the soil is partly a laterite clay and partly a red-coloured coarse grained sand (eastern Vindhyan formation). In thana Goghat the soil is composed of the detritus of the uplands, i.e., broken laterite, kankar and older alluvium.

The principal crops of the district are rice (the staple crop), pulses, oilseeds, jute, sugarcane, tobacco and betel-leaf. Fruits are also grown, chiefly mango, jack, papaya, leechees, pine-apple, custard-apple and melon. Limes and tamarind grow well. Vegetables are also grown extensively, the district being noted for its large vegetable gardens. Among miscellaneous products may be mentioned chillies, mulberry, bamboos and the *hugla* reed.

Artificial irrigation is practised to some extent in this district. Canal irrigation is represented by the Eden Canal system, which takes off from the Damodar river in the Burdwan district, and in its lower reaches irrigates a small area in the centre of the northern portion of the Hooghly district. Irrigation by the tank system, from the large number of tanks, jheels and khals with which the tract is covered, is extensively resorted to for the supply of the water necessary for the cultivation of special crops, such as sugarcane, potatoes, onions, betel-leaf and spring rice. These sources of supply are also used for irrigating other crops in years of drought.

VII—Industries, hâts and melas.

From the industrial point of view the district may be divided into two portions, the first being a long narrow strip lining the west bank of the Hooghly and extending from the southern boundary of the district to near Magra, at which place the Grand Trunk Road leaves the river and takes a westerly and inland direction. The second, which includes the rest of the district, is mainly agricultural, and here the only factory industry followed on a large scale is rice-milling. In the first portion, on the other hand, there are as many as seven separate industrial towns, containing 38 factories, including cotton, jute and rice-mills and other miscellanous factories. The strip is exceptionally well served by communications, having the river Hooghly, the East Indian Railway, and the Grand Trunk Road all most conveniently disposed. Most of the mills and factories are situated either on or close to the western bank of the river. The disposition of the various mills and factories in both the portions of the district noticed above is: 23 at Serampore, 14 at Pandua, 9 at Magra, 4 at Utterpara, 3 each at Chinsura and Bhadreswar, and 1 each at Chanditola, Tarakeswar and Arambagh. The names given above refer to thana areas. Brick and tile-making and the grinding of surki are carried on in the land adjoining the Hooghly and the Bally khal.

Of the non-factory industries, cotton-weaving is the most important. Silk and tusser weaving, rope-making, the manufacture of brass and bell-metal ware, the manufacture of sugar, carpentry, chikon-work, basket-making and pottery are also pursued as industries in various parts of the district.

About 8·7 per cent. of the total population is solely engaged in industries.

As is the case in all districts of the province the sale of local produce and the purchase of every-day necessities take place at rural markets called "hâts," the duration of which is limited to a day or less, and at more pretentious fairs called "mêlas," which may extend into several days or even weeks. Hâts, which are usually held weekly, but may in the more thickly populated areas be held bi-weekly or even daily, vary greately in size, the attendance ranging from a modest gathering of 50 or so to as much as several

thousands. Mêlas are periodic gatherings usually taking place annually, although in some cases two or three mêlas may be held during the year at the same place. Excluding those of minor importance there are 128 hâts and 79 mêlas in the district. The particulars of these are given in Appendix II to this chapter, and their locations are shown in the skeleton sketch map of the district (Plate IX), each item being indicated by an index number which corresponds with the number assigned to the particular item in the list.

VIII—Waterways, steamer services and ferries.

The district abounds in navigable waterways, the most important of which are the rivers Hooghly, Damodar and Rupnarayan, the first named having from time immemorial been the highway for the commerce of Western Bengal. Moreover, in the rains almost all the creeks (khals) and channels are able to carry boats of at least 10 maunds burden. Of the three rivers mentioned, the Hooghly is navigable all the year round throughout its length along the district (50 miles) by river steamers and boats of all sizes; the Damodar is navigable in the rains by boats of 1,000 maunds burden, while the Rupnarayan is navigable from Bandar downwards to Ranichak (6 miles) by river steamers in the rains and by boats of 20 maunds burden at other time of the year. The only other important navigable channel is the Darakeswar which maintains a navigable depth for boats of shallow drafts only during the rains. The rivers Saraswati, Panseuli and Mundeswari are navigable by small boats during floods only. The Behula, Kunti, Kana Nadi, Kana Damodar, Madaria khal and the Danconi drainage khal are also navigable by small boats during the rainy season.

There is a tri-weekly service of steamers belonging to the Calcutta Steam Navigation Company between Hatkhola Ghat, Calcutta, and Kalna in Burdwan. This line is convenient for passengers for Tribeni and places further up, as they are situated some distance from the East Indian Railway. Another line of steamers runs from Armenian Ghat, Calcutta, to Ranichak in the Midnapore district. In the rains small steamers go up to Ghatal, touching at Bandar in this district.

Excluding minor private ferries there are altogether eight recognised public ferries in the district, all controlled by the District Board. Particulars of the more important of these are given in Appendix III to this chapter, and their locations are shown in the skeleton sketch map of the district (Plate IX), each item being indicated by an index number which corresponds with the number assigned to the particular item in the list.

IX—Railways.

Railway communication within the district is provided by nine sections of railway with a total length of about 174·5 miles. The location of these railways is shown in the skeleton sketch map of the district (Plate IX), and a few of the more important particulars relating to them are given in Appendix IV to this chapter. As will be seen from the map the extent to which the country is served by its railways varies considerably. Taking the river Damodar as the dividing line, the eastern section of the district, which contains the entire railway system, is very well served, the lines being well placed and within easy reach of all the important places in the tract. On the other hand the western section, which comprises about one-third of the total area of the district, is marked by the entire absence of railways, and is so cut off by the Damodar from the rest of the district that little advantage can be taken of the railways situated on the other side of this river. The district contains approximately 14·68 miles of railway in respect of each 100 square miles of country.

X—Existing road system.

The road system at present in existence in the district comprises an approximate total length of 2,387 miles of metalled and unmetalled roads of all classes, for the upkeep of which several authorities are responsible. The mileage of the roads under each administrative authority in the district, and the average annual expenditure incurred on their upkeep is given below. The figures shown have been obtained from the respective authorities, but must be taken as being only approximately correct, as in many cases the records and accounts are not kept in such a way as to make it possible to obtain accurate information under the separate heads into which the roads have been divided. They are, however, of sufficient accuracy to serve the purpose of the present report :—

Class.	Authority responsible for upkeep.	Metalled roads.			Unmetalled roads.		
		Mileage on 31st March 1937.	Total annual expenditure being the average for quinquennium ending 31st March 1937.	Average annual expenditure per mile.	Mileage on 31st March 1937.	Total annual expenditure, being the average for quinquennium ending 31st March 1937.	Average annual expenditure per mile.

(*a*) Includes (*i*) 11·5 miles of bitumen or tar grout, and (*ii*) 34·00 miles of bitumen or tar paint.

(*b*) Includes (*i*) 0·26 mile of bitumen or tar grout, (*ii*) 0·15 mile of bitumen or tar paint, (*iii*) 101·65 miles of hard stone metal, and (*iv*) 16·42 miles of brick-metal.

(*c*) Represents average on 108·2 miles.

(*d*) Brick-metal.

The first two of the classes listed above, viz., *Government* roads and *district* roads, form the main lines of communication in the district, and constitute the most important portion of the road system. A detailed list of the roads included under these two classes is given in Appendix V to this chapter, and the alignments followed by them are shown in the skeleton sketch map of the district (Plate IX), each item being indicated by the same index number in both the map and the list so as to facilitate reference. In the case of the *district* roads these index numbers also correspond with the schedule numbers shown in the most recent approved

schedule of roads issued under the authority of the District Board, in which will be found brief particulars showing crest width, metalled width, number and types of bridges, etc., of all district and subdivisional roads. This record being in existence and always available for reference, no attempt has been made to reproduce the information in the present report. The remaining three classes of roads, viz., *subdivisional, urban and village* roads, are of minor importance from the point of view of the present scheme and have therefore neither been listed nor shown on the map.

XI—Road investigations and traffic census.

An account of the investigations carried out with the object of studying the nature of the existing roads and bridges in the several districts of the province has already been given in Chapter V, which deals with this question for the province as a whole. As explained in the same chapter, details of the observations taken, although not included in the present report, have been placed on record in the office file. In this district the examination made and particulars recorded relate to 189 miles of road and 6,235 running feet of bridging, which includes 4 major bridges and 380 minor bridges and culverts. Particulars of the bridges on the existing railways in the district were also collected to help in the examination of the general drainage conditions and the study of the important question of obstruction to the same caused by the construction of raised embankments. A classification according to length of opening has been made of the waterway of the bridges on the more important road and railway embankments existing in the district. This is shown in Appendix VI to this chapter.

A census of traffic was taken by actual count on some of the roads in the district selected as representative of the several classes into which the existing road system could be graded according to volume of traffic carried. Each traffic observation covered a period of seven consecutive days and nights. In a few cases the observations were repeated at the same point at different times of the year, so as to indicate the extent to which the traffic varied. A complete record of the observations taken is given in Appendix VII to this chapter, and an examination of the results will be found in Chapter V, in which the general question of traffic statistics in the province as a whole is dealt with.

On account of the heavy cost involved the preparation of a record of traffic by actual count had to be restricted to only a few roads in the district. Steps were, however, taken to obtain a rough idea of the total traffic on each of the other important roads in the district, the method employed being to have these roads arranged approximately in relative order of traffic importance as compared with the roads on which actual observations had been taken. This was done by the District Engineer in consultation with his staff, these officers having a good knowledge of local conditions, and being in the best position to judge of the probable traffic intensities on the roads under their control. The results, including both the actual observations and the approximations mentioned above, are shown in graphical form in Appendix VIII to this chapter.

XII—Scheme for improved roads.

The general principles followed in selecting the alignments for the roads included in the improved road system in the several districts in the province have already been explained in Chapter VI, and need not be repeated here. In accordance with these principles, a complete scheme has been framed in the district for a road system which is considered sufficiently comprehensive to serve the needs of the district to a reasonable degree, in respect of both internal communication within the district itself, and of inter-district, provincial and inter-provincial communication.

The roads included in the complete district scheme are listed below, each item being assigned an index letter for use in referring to the item in other parts of the report:—

Index letter.	Location.		Approximate length in miles.	Classification.
	From—	To—		
A	Bally ..	Dohipur ..	44	Provincial—Trunk.
B	Baigachhi ..	Keatara ..	34	Ditto.
C	Paita ..	Khatul ..	12	Ditto.
D	Surul-Chowmatha	Harihar ..	10	Ditto.
E	Sepahigachi ..	Kirtichandrapur	30	District—Main.
F	Chinsura ..	Bhandarhati ..	20	Ditto.
G	Bhandarhati ..	Champadanga ..	12	Ditto.
H	Dadpur ..	Bakulia ..	25	Ditto.
I	Inchora ..	Balagarh ..	7	District—Secondary.
J	Serampore ..	Sitapur ..	17	Inter-district—Main.
K	Uttarpara ..	Kalipur ..	5	District—Main.
L	Joyrampur ..	Palaspai ..	19	Ditto.
M	Rajhati ..	Kagnan ..	6	Provincial—Trunk.
N	Arambagh ..	Badanganj ..	15	District—Secondary.
O	Singur ..	Moshat ..	7	Ditto.
		Total ..	263	

A descriptive statement showing particulars of length, route, purpose served, cost, etc., of the items is given in Appendix IX to this chapter, and the location of the roads is shown in the skeleton sketch map of the district (Plate IX), the same index letters being used both in the statement and in the map in order to facilitate reference.

The figures given in the statement to show the approximate cost for the several items included in the scheme are based on rough estimates worked out after brief examination at site and collection of the necessary data. The type of investigations made, and the method employed for preparing the rough estimates, have been described in Chapter VIII, which deals with the question of the preparation of rough estimates for the whole province. As explained in the same chapter it must be clearly understood that the figures furnished in these estimates, although not based on haphazard guess work, cannot be taken as representing correctly the expenditure likely to be involved during actual construction, and cannot therefore be used for obtaining administrative approval.

A record of the observations made and the complete rough estimates for the items of the scheme are given in Appendix X to this chapter. It will be seen that two alternative rough estimates have been prepared for each item, the first in accordance with Specification "A," and the second in accordance with Specification "B." The details of these specifications, and the reasons which have led to the adoption of two alternative standard specifications, have been fully explained in Chapter VII, which deals with the general question of the adoption of standard specifications for the complete road scheme in the whole of the province.

The total length of improved roads proposed in the district is 263 miles, which includes 89 miles of existing metalled road, 122 miles of existing unmetalled road, and 52 miles of entirely new road, these figures being approximate, as the lengths are susceptible to change when the detailed alignments are actually set out. The total estimated cost of the district scheme (inclusive of bridging) stands at Rs. 131·75 lakhs as per Specification "A" and Rs. 94·75 lakhs as per Specification "B." The scheme provides 1 mile of road in respect of every 4·5 square miles of area, or in respect of every 4,237 heads of population in the district. On the assumption that a road, railway or steamer service is capable of tapping the

country lying within 5 miles on either side of it, and neglecting obstructions which may be offered by unbridged rivers, the existing railways and steamer services and the proposed roads, when taken together, will serve 98·3 per cent. of the total area of the district, leaving untapped only 20 square miles of country as indicated in the skeleton sketch map of the district (Plate IX). The area directly served by the road system alone amounts to approximately 1,156 square miles representing 97·3 per cent. of the total area of the district.

The scheme provides for the connection by road of the district headquarters and the headquarters of all subdivisions. Direct road connection has also been provided to sixteen thana headquarters, while the headquarters of the two remaining thanas, although not directly connected, will be within 5 miles of an improved road, which will make it easy for a short connecting link to be added at a later stage.

XIII—Acceptance of district scheme for improved roads by district and other authorities.

A descriptive list of the roads included in the complete district scheme, together with a sketch map showing their positions, was sent to the authorities mentioned below for examination and expression of their opinion as to the suitability of the scheme from their respective points of view. The extent to which the scheme has been approved or objected to by the various authorities is given below:—

(1) District Board.—Approves scheme in full.

(2) Collector.—Approves scheme in full.

(3) Commissioner.—Approves scheme in full.

(4) East Indian Railway.—Approves scheme, but objects to the following items:—

(*i*) Item No. B—in respect of its entire length—Baigachi to Keatara.

(*ii*) Item No. II—in respect of the length between Inchura and Bakulia.

(5) Bengal Provincial Railway.—Approves scheme, but objects to the following item:—

(*i*) Item No. B—in respect of its entire length—Baigachi to Keatara.

(6) Howrah-Amta and Howrah-Sheakhala Railways.—Object to the following items:—

(*i*) Item No. B—in respect of the length between Baigachi and Sheakhala.

(*ii*) Item No. E—in respect of the length between Sipahigachi and Champadanga.

The objections raised by these railways and any alternative proposals suggested by them are dealt with separately in Chapter XXXVII.

In order to make the report self-contained in respect of the important question relating to acceptance of, or objection to, the scheme by the several authorities concerned, and to place on record such documents as may be required for reference in dealing with this question at a later date, it has been considered desirable to attach copies of the correspondence on the subject with the various parties.

Copies of the correspondence with the Collector and the Chairman, District Board, which relate exclusively to this district, are given in Appendix XI to this chapter.

Copies of the correspondence with the Commissioner of the Burdwan Division, which relate to the six districts forming the division, are given in Appendix IX to Chapter XXXVII.

Copies of the correspondence with the railways, which relate to the entire area served by these lines, are given in Appendix IV to Chapter XXXVI.

In this district therefore unanimous acceptance by all parties concerned has been obtained only in respect of the undermentioned items, and to the extent noted against each :—

Items Nos. A, C, D, F, G, I, J, K, L, M, N, and O.—Entire lengths.

Item No. E.—Champadanga to Kirtichandrapur.

Item No. H.—Dadpur to Inchura.

XIV—Order of priority for construction.

The question of the order in which the roads selected to form the complete district scheme should be taken up for construction, has also been considered from the district point of view. The views of the Collector of the district and of the District Board on this subject were invited, and copies of the relevant correspondence are given in Appendix XI to this chapter. The order in which the district authorities place the items included in the scheme is shown below :—

Index letter.	Location.		Order of priority assigned by—	
	From—	To—	District Board.	Collector.
A	Bally ..	Debipur ..	I	The Collector agrees with the District Board.
B	Baigachhi ..	Keatara ..	II	
C	Paita ..	Khatul ..	III	
D	Surul-Chowmatha	Harihar ..	IV	
E	Sepahigachi ..	Kirtichandrapur	VII	
F	Chinsura ..	Bhandarhati ..	IX	
G	Bhandarhati ..	Champadanga ..	V	
H	Dadpur ..	Bakulia ..	VI	
I	Inchora ..	Balagarh ..	XI	
J	Serampore ..	Sitapur ..	VIII	
K	Uttarpara ..	Kalipur ..	....	
L	Joyrampur ..	Palaspai ..	X	
M	Rajhati ..	Kagnan ..	XII	
N	Arambagh ..	Badanganj ..	XIII	
O	Singur ..	Moshat ..	XIV	

APPENDICES TO CHAPTER XII.

Appendix I.

Hooghly.

List of subdivisions and thanas, showing area, population and density as per 1931 census.

Subdivisions and thanas.	Area.	Population.	Density per sq. mile.
1	2	3	4
	Sq. miles.	Number.

Appendix VIII.

Hooghly.

Diagram showing average weight in tons of motor and non-motor traffic (per day of 24 hours) with figures for pedestrian traffic.

Serial No.	Index No.	Name.
		Road from—
31	67	Gaja to Rajbalhat.
32	10	Boinchee to Dasghara.
33	15	Dhaniakhali to Khanpur.
34	94	Subirchak to Badanganj.
35	59	Autpur to Sitapur.
36	7	Bhadreswar to Nasibpur.
37	31	Jangipara to Pursura.
38	55	Somra to Dumurdaha.
39	74	Moshat to Dihitpur.
40	90	Goghat to Kumarganj.
41	31	Chanditola to Jangipara.
42	52	Ramnathpur to Haral.

Serial No.	Index No.	Name.
		Road from—
43	57	Tribeni to Guptipara.
44	66	Gangadharpur to Nawabpur.
45	87	Arambagh to Udrajpur.
46	89	Bhikdas to Balli.
47	25	Mogra to Khanpur.
48	35	Tarakeswar to Jamdara.
49	71	Harananda to Dihakash.
50	84	Arambagh to Arandi.
51	65	Dipa to Baligori.
52	80	Singur to Moslat.
53	85	Arambagh to Bondar.

NOTE.—Roads carrying traffic of less than 10 tons per day of 24 hours have not been included in the graph.

Appendix IX.

Hooghly.

Statement showing particulars of item included in the road system recommended for improvement.

Index No.	Classification.	Location.			Purpose served	Sub-sections.			Length in miles.	Rough cost in rupees.	
		From—	To—	Route.		No.	From—	To—		Specification "A."	Specification "B."
1	2	3	4	5	6	7	8	9	10	11	12
A	Provincial—Trunk	Bally ..	Debipur (Burdwan district boundary).	Following Grand Trunk road (No. 1P) for the whole length.	The Grand Trunk road is at present the main traffic route through the district and serves the most important area of district which lies on the bank of the Ganges up to Magra. The portion of the road beyond Magra diverges from the river and leads into the Burdwan district.	1 2 3 4 5	Bally .. Serampore .. Chinsura .. Magra .. Pandua ..	Serampore .. Chinsura .. Magra .. Pandua .. Debipur ..	6·00 16·00 10·00 9·00 8·00	25,000 25,000 1,00,000 1,00,000 75,000	.. ..
B	Ditto ..	Baigachhi (Howrah district boundary).	Keatara (Burdwan district boundary).	Following District Board road No. 31 up to Sepahigachi, District Board road No. 19 to near Haripal, District Board road No. 18 to Dhaniakhali, District Board road No. 15 for about 4 miles, and thence by new alignment to the district boundary near Keatara.	The road will form a section of the bi-pass to the Grand Trunk Road between Howrah and Memari, from which point two Trunk roads branch; one, the Grand Trunk road, leading to the west and the other a proposed Trunk road leading ultimately to North Bengal.	1 2 3 4 5 6	Baigachhi .. Chanditala .. Sheakhala .. Sepahigachi .. Haripal .. Dhaniakhali ..	Chanditala .. Sheakhala .. Sepahigachi .. Haripal .. Dhaniakhali .. Keatara ..	2·00 8·50 3·50 3·30 9·50 6·00	1,00,000 3,25,000 1,25,000 1,25,000 3,50,000 2,50,000	50,000 1,75,000 75,000 75,000 1,75,000 1,50,000
C	Ditto ..	Kirtichandrapur (Burdwan district boundary).	Khatul (Bankura district boundary).	Following District Board road No. 1 for about one mile, new alignment for about 4 miles to Madina and District Board road No. 31 to district boundary.	The road forms a section of the Trunk road leading to Bombay and Madras, of which a portion (Burdwan-Arambagh Road) has already been taken up for construction.	1 2	Kirtichandrapur .. Surul-Chowmatha	Surul-Chowmatha Khatul ..	6·10 4·00	8,25,000 1,75,000	7,25,000 1,00,000
D	Ditto ..	Surul-Chowmatha	Harihar (Midnapore district boundary).	Following District Board road No. 95	The road forms a section of the Midnapore Trunk road, being in continuation of the Trunk road already under construction leading from Burdwan towards the south.	1	Surul-Chowmatha	Harihar ..	10·13	4,00,000	2,50,000

E	District—Main ..	Sepahigachi on item B above.	Kirtichandrapur on item C above.	Following District Board roads Nos. 31 and 1.	The road will form the main line of communication connecting the Arambagh subdivision with the road system on the east of the Damodar and also with the Trunk road leading to Burdwan. The section between Champadanga and Jairampur is subject to heavy inundation and this length of road, although essentially required will be expensive to construct.	1	Sepahigachi ..	Pursura (Champadanga).	11·00	4,50,000	2,75,000
						2	Pursura (Champadanga).	Rasulpur ..	7·00	15,00,000	14,00,000
						3	Rasulpur ..	Arambagh ..	6·00	5,75,000	4,75,000
						4	Arambagh ..	Kirtichandrapur ..	4·83	3,50,000	2,25,000
F	Ditto ..	Chinsura on item A above.	Bhandarhati on item B above.	Following District Board roads Nos. 14 and 15 to above one mile west of Dadpur, and thence by new alignment to meet the Trunk road "B" above, about 1½ miles south of Dhaniakhali.	The road will form the main east-west line of communication running from district headquarters through the heart of the district.	1	Chinsura ..	Dadpur ..	11·00	5,50,000	2,75,000
						2	Dadpur ..	Bhandarhati ..	8·00	4,00,000	2,50,000
G	Ditto ..	Bhandarhati on item B above.	Champadanga on item E above.	Following new alignment for about 6 miles to Tarakeswar and thence by District Board road No. 82 to meet item E near Champadanga.	The road forms a continuation of item F providing communication in the area lying round Tarakeswar. It will serve as a feeder to the railway.	1	Bhandarhati ..	Tarakeswar ..	6·00	4,00,000	3,25,000
						2	Tarakeswar ..	Champadanga ..	4·50	2,25,000	1,25,000
H	Ditto ..	Dadpur on item F above.	Bakulia (Burdwan district boundary).	Following District Board road No. 51 up to Darbasini (4½ miles), then by a new alignment up to the junction of District Board roads Nos. 49 and 20 (¾ mile) and thence up to Pandua (7¾ miles) by District Board road No. 49 and thence by District Board road No. 32 up to the district boundary at Bakulia.	The road will form the main cross line of communication running through the north-eastern portion of the district and will link up with the Kalna road in the Burdwan district. It will serve as a feeder to three lines of railway	1	Dadpur ..	Pandua ..	12·78	5,50,000	4,00,000
						2	Pandua ..	Inchura ..	9·15	3,50,000	2,25,000
						3	Inchura ..	Bakulia ..	3·50	1,75,000	1,50,000
I	District—Secondary	Inchura on item H above.	Balagarh and on to west bank of Bhagirathi.	Following District Board road No. 42 for about 3½ miles and thence by new alignment to district boundary on the west bank of Bhagirathi near Balagarh.	The road forms a branch to item H leading to the thana at Balagarh and then to the river opposite a corresponding road in the Nadia district.	1	Inchura ..	Somra ..	3·67	1,50,000	1,00,000
						2	Somra ..	Balagarh ..	2·38	1,00,000	75,000
J	Inter-district—Main	Serampore on item A above.	Sitapur (Howrah district boundary opposite Jagatballavpur railway station).	Following District Board road No. 29 to Sheakhala, new alignment for about 3 miles and District Board road No. 74 to district boundary near Sitapur.	The road forms a cross line of communication in the south of the district connecting the two Trunk roads, items A and B, and linking up with the road system of the Howrah district leading to Amta	1	Serampore ..	Monirampur ..	6·10	3,00,000	2,25,000
						2	Monirampur ..	Sheakhala ..	5·00	2,50,000	1,50,000
						3	Sheakhala ..	Sitapur ..	6·10	2,75,000	2,00,000

1	2	3	4	5	6	7	8	9	10	11	12
K	District—Main ..	Uttarpara on item A above.	Kalipur on item B above.	Following District Board Road No. 36.	The road forms a short but important cross connection between the Trunk roads—items A and B in the extreme south of the district	1	Uttarpara ..	Kalipur ..	4·40	2,25,000	1,75,000
L	Ditto (Sub-section No. 3 is Provincial—Trunk.)	Joyrampur on item E above.	Palaspai ..	Following entirely a new alignment passing between— (i) Kanpur and Madhabpur. (ii) Kapsit and Dihi-Bagnan. (iii) Gourhati and Para-Bagnan. and thence to Khanakul *via* Ramnagar, thence *via* Rajhati-Sabalsingpur, and Harischuk to Palaspai.	The road will form the main line of communication in the southern portion of the Arambagh subdivision and will connect up with the road system in the Howrah district.	1 2 3	Jairampur .. Khanakul .. Rajhati ..	Khanakul .. Rajhati .. Palaspai ..	11·31 3·00 5·00	8,25,000 2,00,000 6,75,000	6,50,000 1,50,000 6,00,000
M	Provincial—Trunk	Rajhati ..	Kagnan ..	Following entirely a new alignment	The road will form a short link between the road system in the Hooghly and Midnapore districts.	1	Rajhati ..	Kagnan ..	4·13	4,50,000	3,75,000
N	District—Secondary	Arambagh (west bank of Darakeswar) including short link to connect up with item M of Bankura district.	Badanganj ..	Following District Board road No. 2 up to Pandugram and thence by District Board road No. 94 to Badanganj with short extension northwards starting about one mile east of Badanganj.	This road provides an east-west line of communication running from the subdivisional headquarters to the extreme western corner of the district, which is capable of development. The bridging of Darakeswar not included in the scheme.	1 2	Arambagh .. Pandugram ..	Pandugram .. Badanganj ..	9·56 7·00	5,00,000 3,75,000	3,50,000 2,50,000
O	Ditto ..	Singur ..	Moshat ..	Following District Board road No. 80.	This road will afford connection between two adjacent east-west roads and two different railways. The inclusion is due only to the special desire of the District Board and subject to acceptance by the railway authorities.	1	Singur ..	Moshat ..	6·82	3,50,000	2,75,000
								Total ..	255·26	1,31,75,000	94,75,000
